Note of appreciation

Canada owes the success of its statistical system to a long-standing partnership between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued cooperation and goodwill.

Note de reconnaissance

Le succès du système statistique du Canada repose sur un partenariat bien établi entre Statistique Canada et la population, les entreprises, les administrations canadiennes et les autres organismes. Sans cette collaboration et cette bonne volonté, il serait impossible de produire des statistiques précises et actuelles.

ACKNOWLEDGEMENTS

A great number of people contributed to this complex statistical product that was prepared under the direction of François Nault. First and foremost, it is the work of the people of the Demographic Estimates Section of Demography Division: Lise Champagne, Lucette Dell'Oso, Julie Dussault, Michael Hanrahan, Verne Kawka, Ian Kisbee, Hélène Landry, Daniel Larrivée, Shirley Loh, Gerry Ouellette, Denis Prud'homme and Danielle St-Germain. Carole Stuart took care of the CD-ROM. Linda McCormick prepared the animated age pyramids. The printed publication was facilitated by Sue Lineger and Jacques Tessier. All the activities received the full support of Réjean Lachapelle and Gilles Montigny.

Such a publication would not be possible without the collaboration of the organizations which supply data: the provincial and territorial vital statistics registries; Citizenship and Immigration Canada; Canada Customs and Revenue Agency; and the Canadian and U.S Departments of Justice. Part of the data are either compiled or processed by Health Statistics Division and Small Area and Administrative Data Division in Statistics Canada. Their contribution is gratefully acknowledged. Finally, special thanks go to the provincial and territorial focal points for their regular and thorough review and evaluation of the data.

REMERCIEMENTS

Un grand nombre de personnes ont apporté leur contribution à ce produit statistique complexe qui a été préparé sous la direction de François Nault. Il est d'abord et avant tout le résultat du travail du personnel de la Section des estimations démographiques de la Division de la démographie: Lise Champagne, Lucette Dell'Oso, Julie Dussault, Michael Hanrahan, Verne Kawka, lan Kisbee, Hélène Landry, Daniel Larrivée, Shirley Loh, Gerry Ouellette, Denis Prud'homme et Danielle St-Germain. Carole Stuart s'est occupée du CD-ROM. Linda McCormick a préparé les pyramides par âge animées. La publication imprimée a été rendue possible grâce à Sue Lineger et Jacques Tessier. Toutes les activités ont reçu le plein appui de Réjean Lachapelle et Gilles Montigny.

La présente publication n'aurait pas été possible sans la coopération des organismes qui nous fournissent les données: les registraires provinciaux et territoriaux de l'état civil, Citoyenneté et Immigration Canada, l'Agence des douanes et du revenu du Canada et le Ministère de la Justice du Canada et celui des États-Unis. Une partie des données nous parvient par l'entremise de la Division des statistiques sur la santé et de la Division des données régionales et administratives de Statistique Canada. Leur contribution mérite d'être reconnue. Enfin, des remerciements particuliers vont aux coordonnateurs statistiques provinciaux et territoriaux pour l'évaluation et la vérification répétées et approfondies qu'ils font des données.

The paper used in this publication meets the minimum requirements of American National Standards for Information Sciences – Permanence of Paper for Printed Library Materials, ANSI Z39.48 – 1984 \bigcirc

NEW - NEW - NEW

Population Projections for Canada, Provinces and Territories, 2000-2026

What is in store for Canada's demographics in the next twenty-five to fifty years?

The report, just released, brings to light a host of startling demographic developments in Canada and the related major issues which will confront our generation and those to come.

This publication contains Statistics Canada's first population projections of the new century for Canada provinces and territories by age and sex. The projections use preliminary population estimates for 2000 as their base. These in turn were based on the 1996 Census population, adjusted for net census undercoverage.

The projections take into account emerging demographic trends, primarily based on recent changes in the components of population growth. These include notable changes in immigration levels, a further reduction in fertility levels, a continued increase in life expectancy and significant changes in interprovincial migration trends.

Provides:

- A detailed description of projection methods and component assumptions: fertility, mortality/life expectancy, immigration, total emigration, non permanent residents, and interprovincial migration;
- Four projection series representing three growth scenarios (high, medium, and low) by age and sex up to 2026 for provinces and territories and up to 2051 for Canada;
- An analysis of projection results with figures and summary tables highlighting the major changes in future population growth and age and sex structure of the population focusing on school age, working age, and aging;
- An evaluation of the accuracy of past projections;
- Over 180 pages of textual material with graphics and summary tables, explanatory notes, glossary, references, and detailed projections tables.

An invaluable publication for planners, policy makers, the media, social scientists and the public at large interested in the future course of demographic trends in Canada.

To order these publications, you may telephone (613) 951-7277 or fax (613) 951-1584 or internet: order@statcan.ca. You may also call 1-800-267-6677 (Canada and United States) toll free. If you order by telephone, written confirmation is not required.

NOUVEAU - NOUVEAU - NOUVEAU

Projections démographiques pour le Canada, les provinces et les territoires, 2000-2026

Que nous réserve la démographie canadienne pour les prochaines vingt-cinq à cinquante années?

Le rapport, maintenant disponible, met en lumière un ensemble saisissant d'éléments démographiques canadiens ainsi que les principales questions auxquelles seront confrontées les générations présentes et futures.

Cette publication présente les premières projections démographiques à être diffusées au XXI^{temé} siècle pour le Canada, les provinces et les territoires, selon l'âge et le sexe. Ces projections ont comme population de départ les estimations provisoires au 1er juillet 2000. Ces dernières ont été établies à partir des résultats du recensement de 1996, rajustés pour le sous-dénombrement net.

Les projections tiennent compte des nouvelles tendances démographiques établies à partir des changements récents dans les composantes de l'accroissement démographique qui comprennent des changements notables dans l'immigration, la baisse constante de la fécondité, les gains d'espérance de vie et les variations importantes de la migration interprovinciale.

Comprend:

- Une description détaillée des méthodes de projection et des diverses hypothèses au sujet des composantes: fécondité, mortalité et espérance de vie, immigration, émigration totale, résidents non permanents et migration interprovinciale;
- Quatre séries de projections qui donnent trois scénarios de croissance (fort, moyen et faible) par âge et sexe jusqu'en 2026 pour les provinces et les territoires et jusqu'en 2051 à l'échelle du Canada;
- Une analyse des résultats illustrés de tableaux et graphiques qui éclairent les changements majeurs dans l'évolution future de l'accroissement démographique et de la distribution de la population par âge et sexe avec une emphase particulière sur les années d'âge scolaire, de participation sur le marché du travail et de retraite;
- Une évaluation de l'exactitude des projections passées;
- Plus de 180 pages de texte, comprenant graphiques, tableaux sommaires, notes explicatives, lexique, références et tableaux détaillés de projections.

Une publication indispensable aux agents de planification, aux décideurs politiques, aux médias, aux chercheurs dans le domaine social ou simplement aux citoyens intéressés par l'évolution future des tendances démographiques au Canada.

Vous pouvez aussi appeler sans frais (Canada et États-Unis) au 1-800-267-6677. Il n'est pas nécessaire de nous faire parvenir une confirmation écrite pour une commande faite par téléphone.

INTRODUCTION

This issue of *Annual Demographic Statistics* is organized by level of geography: (1) province and territory, (2) Census Metropolitan Area and (3) Census Division. Estimates of the total population, components of demographic growth, and distribution by age group and sex are provided at each level. The tables on the components comprise estimates in absolute numbers and rates to facilitate comparisons. Section 4 provides estimates of Census families while Section 5 provides selected vital statistics. The population projections for the 2001-2005 period are presented in the same tables as estimates.

The emigration estimates include Canadians who are temporarily abroad and don't maintain a residential link to Canada, from July 1 1996, on. As a result, a break in the emigration time series occurs in 1996.

The CD-ROM contains one new data series: the population estimates by sex, age and legal marital status, Canada, provinces and territories, 1996-2000. Consequently, users, may now choose between a distribution by "historical" marital status, where partners in common-law unions are categorized as married, or legal marital status, where they are categorized either as single, divorced or widowed, depending on their legal status. All time series are in a spreadsheet format and can be manipulated on a PC.

Although the figures in the statistical tables are unrounded, they should not be considered precise. They are the best possible estimates given the most current information available. At the time of preparation of this publication, counts of deaths were available only up to 1997, those of births, up to 1998, data used to estimate emigration, up to 1998 (in the case of the temporarily abroad only up to 1996), and no data on the components were available at the subprovincial level for the 1999-2000 period.

INTRODUCTION

La présente édition des Statistiques démographiques annuelles est organisée par niveau géographique: (1) province et territoire, (2) région métropolitaine de recensement et (3) division de recensement. Les estimations de la population totale, des composantes de la croissance démographique et de la distribution par sexe et groupe d'âge sont fournies pour chacun des niveaux. Les tableaux sur les composantes comprennent les estimations en valeur absolue et les taux pour faciliter les comparaisons. La section 4 donne les estimations des familles de recensement et la section 5 quelques statistiques d'état civil. Les projections démographiques pour la période 2001-2005 sont présentées dans les mêmes tableaux que les estimations.

Les estimations de l'émigration incluent les Canadiens qui sont temporairement à l'étranger et qui ne maintiennent pas de lien de résidence avec le Canada à partir du 1er juillet 1996. Il en résulte donc un bris en 1996 dans les séries chronologiques d'émigration.

Le CD-ROM contient une nouvelle série chronologique : les estimations de la population par sexe, âge et état matrimonial <u>légal</u>, Canada, provinces et territoires, 1996-2000. Les utilisateurs peuvent donc choisir entre une distribution par état matrimonial « historique », où les conjoints en union libre sont classés comme mariés ou, par état matrimonial légal, où ceux-ci sont classés soit comme célibataires, divorcés ou veufs selon leur statut légal. Toutes les séries chronologiques sont présentées sous forme de chiffriers et peuvent donc être traitées sur micro-ordinateur.

Bien que les chiffres des tableaux statistiques ne soient pas arrondis, il ne faut pas en déduire qu'ils sont précis à l'unité près. Ils constituent plutôt les meilleures estimations possibles sur la base des plus récentes informations disponibles. Au moment de la préparation de cette publication, les chiffres de décès n'étaient disponibles que jusqu'en 1997, ceux de naissances jusqu'en 1998, les données pour estimer l'émigration (dans le cas des personnes iusau'en 1998 temporairement à l'étranger seulement jusqu'en 1996), et donnée n'était disponible infraprovinciale pour la période 1999-2000.

The 2001-2005 population projections are not predictions. They indicate the future size of the population if current trends in the components of demographic growth (births, deaths and migrations) continue.

With these caveats in mind, we hope that these estimates and projections will prove useful. We would welcome any comments for further improvements.

Les projections pour la période 2001-2005 ne sont pas des prédictions. Elles indiquent l'effectif futur de la population dans l'hypothèse où les tendances récentes dans les composantes de l'accroissement démographique (naissances, décès et migrations) se maintiennent.

En ayant à l'esprit ces réserves, nous espérons que les présentes estimations et projections seront utiles. Nous recevrons avec plaisir les commentaires visant à les améliorer.

Highlights

Canada

On July 1, 2000, the population of Canada was estimated at 30,750,100, up 0.8% from July 1 of the previous year. In absolute numbers, this represents an increase of 256,700 individuals, in comparison with 245,500 in the preceding twelve months. The growth of the Canadian population was therefore somewhat stronger, although it remained below 1% for the third consecutive year.

This slight upward trend can be attributed entirely to an increase in the number of immigrants. Canada accepted 32,000 more immigrants in 1999 (July 1) – 2000 (June 30) than in 1998-1999, or 205,000 as compared with 173,000.

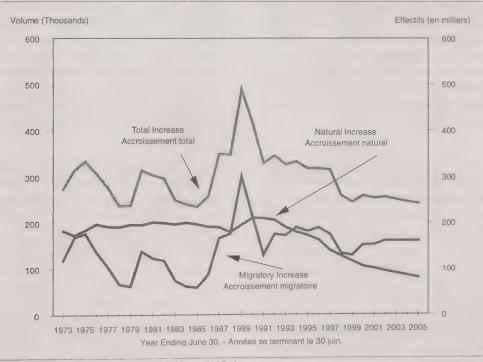

Faits saillants

Canada

Au 1^{er} juillet 2000, la population canadienne était estimée à 30 750 100 personnes, en hausse de 0,8 % par rapport au 1^{er} juillet de l'année précédente. En nombres absolus, cela représente une augmentation de 256 700 personnes, comparativement à 245 500 au cours des douze mois précédents. La croissance de la population canadienne s'est donc quelque peu raffermie, même s'il s'agit de la troisième année consécutive pour laquelle elle est inférieure à 1 %.

Ce léger raffermissement est entièrement attribuable à l'augmentation du nombre d'immigrants. Le Canada a en effet accueilli 32 000 immigrants de plus en 1999 (1^{er} juillet) – 2000 (30 juin) qu'en 1998-1999, soit 205 000 comparativement à 173 000.

Source: CD-ROM, file to7105.xls. - CD-ROM, fichier to7105.xls

The growth in the number of non-permanent residents¹ in Canada declined from 14,600 in 1998-1999 to 8,500 in 1999-2000. The latter numbered nearly 260,000 on July 1, 2000, compared with 251,400 on July 1, 1999 and 236,800 on July 1, 1998. The growth in the year 1999-2000 resulted from an increase of 16,200 in the number of student authorization holders and of 8,700 in work permit holders. This more than offset the decline of 1,400 in the number of Minister's permit holders and the decrease of 15,000 in refugee claimants.

In the absence of recent vital statistics data, other than for Quebec, it was estimated that the number of births exceeded the number of deaths by only 105,000 in 1999-2000, compared with 116,000 the year before. In any event, the structural trend in the decline of natural increase, caused by the ageing of the population, continued.

No new data were available to calculate total emigration. The growth of the population, to which constant emigration rates were applied, along with a continuation of the 1991-1996 trend in the number of Canadians temporarily abroad, resulted in a slightly higher estimate of the total number of emigrants who left Canada in 1999-2000, set at 62,100, as compared with 58,800 the year before.

Since 1993, the Canadian population has grown more from net migration than from natural increase. In 1999-2000, net migration represented 59% of total growth. It exceeded natural increase by 73,000, compared with 9,700 in 1993-1994

La croissance du nombre de résidents non permanents¹ au Canada s'est réduite de 14 600 en 1998-1999 à 8 500 en 1999-2000. On en comptait près de 260 000 au 1^{er} juillet 2000, comparativement à 251 400 au 1^{er} juillet 1999 et à 236 800 au 1^{er} juillet 1998. La croissance de l'année 1999-2000 découle de l'augmentation de 16 200 du nombre des détenteurs d'autorisation d'étude et de 8 700 de celui des détenteurs d'autorisation d'emploi, qui ont plus que compensé pour le déclin de 1 400 du nombre de détenteurs de permis du Ministre et pour la baisse de 15 000 du nombre de revendicateurs du statut de réfugiés.

En l'absence de données récentes d'état civil, sauf pour le Québec, on estimait que le nombre de naissances avait excédé de seulement 105 000 celui des décès, au cours de l'année 1999-2000, comparativement à 116 000 l'année précédente. Quoi qu'il en soit, la tendance structurelle au déclin de l'accroissement naturel, causée par le vieillissement de la population, s'est poursuivie.

On n'a disposé d'aucune nouvelle donnée pour estimer l'émigration totale. La croissance de la population à laquelle on a appliqué des taux constants d'émigration et la continuation du mouvement observé entre 1991 et 1996 dans le nombre de Canadiens temporairement à l'étranger ont conduit à une estimation légèrement plus élevée du nombre total d'émigrants ayant quitté le Canada en 1999-2000, soit 62 100, contre 58 800 l'année précédente.

Depuis 1993, la croissance de la population canadienne est attribuable en plus grande partie au solde migratoire qu'à l'accroissement naturel. En 1999-2000, le solde migratoire représentait 59 % de l'accroissement total. Il excédait l'accroissement naturel de 73 000, comparativement à 9 700 en 1993-1994.

¹ Foreigners with authorization to work or study in Canada, a Minister's permit, or claiming refugee status, along with their dependents (see glossary).

¹ C'est-à-dire les étrangers détenant une autorisation d'emploi ou d'étude au Canada, un permis du ministre, ou revendiquant le statut de réfugié, ainsi que leurs dépendants (voir lexique).

If these trends continue, and assuming that the number of permanent residents remains constant over the next five years, the population of Canada will reach 32 million in 2005.

Provinces and Territories

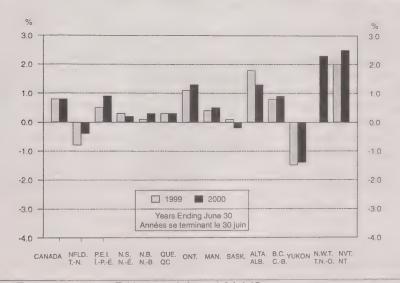

Between July 1, 1999 and July 1, 2000, some changes in the provincial and territorial demographic growth rate were observed as compared with the previous year, but, in general, the basic trends that prevailed in recent years continued.

Si ces tendances se maintiennent mais en supposant que le nombre de résidents non permanents demeure constant au cours des cinq prochaines années, la population canadienne s'établirait à 32 millions en 2005.

Les provinces et territoires

Entre les 1^{ers} juillet 1999 et 2000, on a observé des variations dans les taux d'accroissement démographique des provinces et territoires par rapport à l'année précédente même si, en général, les tendances de fond qui ont prévalu au cours des dernières années ont persisté.

Chart 2. Annual Population Growth Rate, Canada, Provinces and Territories, 1998-1999 and 1999-2000 Graphique 2. Taux d'accroissement annuel, Canada, provinces et territoires, 1998-1999 et 1999-2000

The three provinces that have traditionally had growth rates above the Canadian average (Ontario, Alberta and British Columbia) were joined by Prince Edward Island, due to an exceptionally high level of net interprovincial migration in 1999-2000 (nearly 1,000). The remaining provinces continued to experience relatively slow demographic growth and even negative growth in the case of Newfoundland and Saskatchewan.

Aux trois provinces qui traditionnellement affichent des taux d'accroissement supérieurs à la moyenne canadienne, l'Ontario, l'Alberta et la Colombie-Britannique, s'est ajoutée l'Île-du-Prince-Édouard à cause d'un solde migratoire interprovincial exceptionnellement élevé au cours de l'année 1999-2000 (de près de 1 000). Les autres provinces ont continué à connaître des accroissements de leur population relativement faibles et même négatifs dans les cas de Terre-Neuve et de la Saskatchewan.

Ontario benefited the most from the increase in immigration. That province, which accounts for 38% of the Canadian population, attracted nearly 57% of immigrants in 1999-2000, compared with 53% the previous year. Of the 32,000 additional immigrants that Canada accepted in 1999-2000, 25,000 went to Ontario. Moreover, the net interprovincial migration grew by 3,100, from 16,700 in 1998-1999 to 19,800 in 1999-2000. This also served to explain Ontario's growth rate of 13.1 per thousand, the highest provincial rate.

Alberta moved to second place, with its net interprovincial migration decreasing by more than half, from 25,000 in 1998-1999 to less than 12,000 in 1999-2000.

Changes in interprovincial migration also contributed to the variations in the demographic growth rates in the remaining provinces between 1998-1999 and 1999-2000. Of the six provinces that posted negative net interprovincial migration in 1998-1999, only one (New Brunswick) had a slight positive balance, three had more favourable balances (Newfoundland, Manitoba and British Columbia), while the balance for Quebec and Saskatchewan became more negative. This explains why the growth rate for the first four increased slightly, while it decreased for the latter two.

Nova Scotia's positive net interprovincial migration increased in 1998-1999, but the drop in the number of non-permanent residents and in the province's natural increase resulted in a decline of its population growth.

The Northwest Territories and Nunavut posted very high growth rates due to strong natural increase and net interprovincial migration, which became positive in 1999-2000. However, the population of the Yukon declined for the third consecutive year due to losses through migratory exchanges with the rest of Canada.

L'augmentation de l'immigration a surtout favorisé l'Ontario. Cette province, dont la population représente 38 % de la population canadienne, a attiré près de 57 % des immigrants de l'année 1999-2000, comparativement à 53 % l'année précédente. Ainsi des 32 000 immigrants de plus que le Canada a reçu en 1999-2000, 25 000 sont allés à l'Ontario. À cela s'ajoute un solde migratoire interprovincial qui s'est accru de 3 100, passant de 16 700 en 1998-1999 à 19 800 en 1999-2000, pour expliquer que la province a connu un taux d'accroissement de 13,1 pour mille, le plus fort taux provincial.

L'Alberta est passée au second rang parce son bilan migratoire interprovincial s'est réduit de plus de moitié, passant de 25 000 en 1998-1999 à moins de 12 000 en 1999-2000.

Les changements dans la migration interprovinciale expliquent également les variations dans les taux d'accroissement démographique des autres provinces entre 1998-1999 et 1999-2000. Des six provinces qui affichaient des soldes migratoires interprovinciaux négatifs en 1998-1999, une seule a vu son solde devenir légèrement positif, le Nouveau-Brunswick, trois ont connu des soldes plus favorables, soit Terre-Neuve, le Manitoba et la Colombie-Britannique, alors que le Québec et la Saskatchewan ont vu leur solde respectif empirer. Cela explique que le taux d'accroissement des quatre premières ait légèrement augmenté alors qu'il a diminué pour les deux dernières.

La Nouvelle-Écosse, quant à elle, a vu son solde migratoire interprovincial positif en 1998-1999 s'accroître mais la diminution du nombre de résidents non permanents et de son accroissement naturel ont entraîné une baisse de l'accroissement de sa population.

Les Territoires du Nord-Ouest et le Nunavut ont affiché des taux de croissance très élevés en raison de forts accroissements naturels et de soldes migratoires interprovinciaux, devenus positifs en 1999-2000. Cependant, la population du Yukon déclinait pour une troisième année consécutive à cause de pertes dans ses échanges migratoires avec le reste du Canada.

Census Metropolitan Areas

On July 1, 2000, 62.5% of the population of Canada, or nearly 19.3 million people, resided in one of the 25 census metropolitan areas (CMAs). One third were concentrated in the three main CMAs: Toronto (4.8 million), Montreal (3.5 million) and Vancouver (2.0 million).

An examination of the rates of population growth helps pinpoint areas of growth and decline in Canada. The analysis is based on the 1998-1999 period, the last for which all demographic components are estimated.

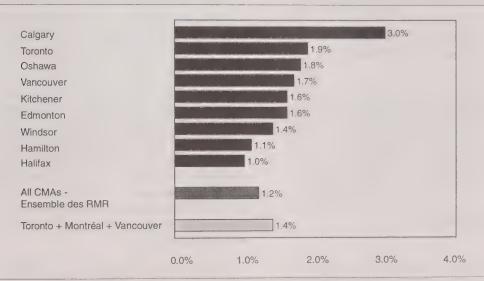

Les régions métropolitaines de recensement

Au 1er juillet 2000, 62,5 % de la population canadienne, soit près de 19,3 millions de personnes, vivaient dans l'une des 25 régions métropolitaines de recensement (RMR). Le tiers était concentré dans les trois principales RMR, soit Toronto (4,8 millions), Montréal (3,5 millions) et Vancouver (2,0 millions).

L'examen des taux d'accroissement de la population permet d'identifier de façon plus précise les pôles de croissance et de décroissance au Canada. L'analyse doit porter sur la période 1998-1999, la dernière pour laquelle toutes les composantes démographiques sont estimées.

Chart 3. Graphique 3.

Census Metropolitan Areas with the Highest Average Annual Growth Rates, 1996-2000 Régions métropolitaines de recensement ayant les taux moyens d'accroissement annuel les plus élevés, 1996-2000

Source: Statistical Table 2.3. - Tableau statistique 2.3

In the east, including Quebec, only the Halifax CMA grew at a rate higher than 10.0 per thousand. The St. John's CMA experienced a slight growth of 1.2 per thousand, in contrast with the decrease it had experienced the previous years and with that of Newfoundland. This is explained by the fact that St. John's attracts some of the population from the rest of the province and that the number of migrants who left

Dans l'est du pays, incluant le Québec, seule la RMR de Halifax a crû à un taux supérieur à 10,0 pour mille. La RMR de St-John's connaissait une légère croissance de 1,2 pour mille, contrastant avec la décroissance qu'elle avait connue au cours des années précédentes et celle que connaît Terre-Neuve. Cela s'explique parce que St-John's attire une partie de la population du reste de la province et que le nombre de migrants qui l'ont quittée

for another province decreased in comparison with 1997-1998. A similar phenomenon also explains why the growth rate of St. John, New Brunswick, went from negative to positive.

In Quebec, the highest growth was in Montreal, albeit only at 6.8 per thousand. The populations of Chicoutimi-Jonquière and Trois-Rivières declined.

Six CMAs in Ontario had growth rates above 10.0 per thousand. They are Toronto (17.3), Oshawa (17.0), Kitchener (16.1), Windsor (14.8), Ottawa-Hull (Ontario portion) (14.4) and Hamilton (10.2). The population in both northern CMAs, Sudbury and Thunder Bay, declined.

Growth in the CMAs of Winnipeg, Regina and Saskatoon was 3.2 per thousand, 3.4 per thousand and 5.8 per thousand, respectively. The three urban areas lost through migratory exchanges with the other provinces, but gained through intraprovincial exchanges.

With a demographic growth rate of 24.8 per thousand, Calgary experienced the most rapid growth in Canada. Calgary was ahead of all other CMAs in both its rate of natural increase (7.3 per thousand) and its net interprovincial migration (12.7 per thousand). It also had a high rate of immigration. Edmonton also posted a very high growth rate of 15.0 per thousand, but on July 1, 2000, the population of Calgary (953,000) surpassed that of Edmonton (944,000).

Vancouver grew by 14.7 per thousand, primarily due to international migration, since it lost through both interprovincial and intraprovincial exchanges. Finally, Victoria had practically no growth (0.3 per thousand). With the most elderly population for an urban area, Victoria is the only CMA with more deaths than births. It also loses in its migratory exchanges with the other provinces, but it attracts migrants from the rest of British Columbia and some immigrants settle there.

pour une autre province a diminué par rapport à l'année 1997-1998. Ce dernier élément explique également que le taux d'accroissement de St-John au Nouveau-Brunswick soit passé du négatif au positif.

Au Québec, c'est Montréal qui connaît la plus forte croissance mais elle n'est que de 6,8 pour mille. Par ailleurs, Chicoutimi-Jonquière et Trois-Rivières ont vu leur population décliner.

L'Ontario compte six RMR dont le taux de croissance est supérieur à 10,0 pour mille. Il s'agit de Toronto (17,3), Oshawa (17,0), Kitchener (16,1), Windsor (14,8), Ottawa-Hull (partie ontarienne) (14,4) et Hamilton (10,2). La population de chacune des deux RMR du nord, Sudbury et Thunder Bay a, quant à elle, décliné.

La croissance des RMR de Winnipeg, de Regina et de Saskatoon était de 3,2 pour mille, 3,4 pour mille et 5,8 pour mille, respectivement. Ces trois régions urbaines perdent dans leurs échanges migratoires avec les autres provinces mais gagnent dans leurs échanges infraprovinciaux.

Avec un taux de croissance démographique de 24,8 pour mille, Calgary connaissait la croissance la plus rapide au Canada. Calgary devance toutes les autres RMR à la fois par son taux d'accroissement naturel (7,3 pour mille) et son solde migratoire interprovincial (12,7 pour mille). Elle connaît également un fort taux d'immigration. Edmonton affichait également un taux de croissance très élevé avec 15,0 pour mille, mais, au 1^{er} juillet 2000, la population de Calgary (953 000) avait dépassé celle d'Edmonton (944 000).

Vancouver a connu une croissance de 14,7 pour mille, principalement due à la migration internationale, puisqu'elle perd à la fois dans ses échanges interet infraprovinciaux. Enfin, Victoria a eu une croissance pratiquement nulle (0,3 pour mille). Région urbaine ayant la population la plus âgée, Victoria est la seule RMR à avoir plus de décès que de naissances. Elle est également perdante dans ses échanges migratoires avec les autres provinces mais elle attire des migrants du reste de la Colombie-Britannique et quelques immigrants s'y installent.

Census Divisions

Census Divisions (CDs) are geographic units that fall between provinces and municipalities. Depending on the province, they represent counties, regional districts or regional county municipalities.

Of the 288 CDs in Canada, 158, or 55%, had an increase in their population between July 1, 1999 and July 1, 2000, while 130 had a decrease. This is similar to what was observed the year before, except that the proportion of CDs having experienced growth decreased from 46% to 38% in Quebec, while in British Columbia, it increased from 36% to 86%. Four CDs showed demographic growth higher than or equal to 3%, while over forty saw their population decline by more than 1%.

The map on page 10 shows which CDs grew or shrank in population. Most of the CDs in the Montreal-Windsor corridor, the urban parts of Manitoba, Saskatchewan, Alberta, and British Columbia posted population gains. There were many CDs that lost population in the Atlantic provinces, on the Gaspé Peninsula, on the north shore of Quebec, on the shores of Lake Superior and Lake Huron in Ontario, in the rural regions of the prairie provinces and in the Yukon.

Les divisions de recensement

Les divisions de recensement (DR) sont des unités géographiques intermédiaires entre les provinces et les municipalités. Selon la province considérée, elles correspondent à des comtés, des districts régionaux ou des municipalités régionales de comté.

Des 288 DR que compte le Canada, 158, soit 55 % d'entre elles, connaissaient une croissance de leur population entre les 1^{ers} juillet 1999 et 2000, alors que 130 connaissaient une décroissance. C'est similaire à ce qu'on observait l'année précédente, sauf que la proportion des DR qui ont connu une croissance a diminué de 46 % à 38 % au Québec alors qu'en Colombie-Britannique, elle augmentait de 36 % à 86 %. Quatre DR ont eu une croissance démographique supérieure ou égale à 3 % alors que plus d'une quarantaine voyaient leur population décroître de plus de 1 %.

La carte géographique à la page 10 permet de distinguer les DR où la population a crû de celles où elle a décrû. La plupart des DR situés dans le corridor Montréal-Windsor, les régions urbaines du Manitoba, de la Saskatchewan, de l'Alberta et de la Colombie-Britannique ont vu leur population s'accroître. Les DR en décroissance sont nombreuses dans les provinces de l'Atlantique, dans la péninsule gaspésienne et la Côte-Nord au Québec, en bordure des lacs Supérieur et Huron en Ontario, dans les région rurales des provinces des prairies ainsi qu'au Yukon.

Statistique Canada

今

Source: Tableau 3.2 Préparé par la Division de la géographie, Statistique Canada, 2001 Source: Table 3.2 Produced by the Geography Division, Statistics Canada, 2001

Using a typology developed by the OECD², the 288 CDs in Canada can be classified into three major types of regions: (i) predominantly urban, (ii) intermediate, and (iii) predominantly rural. At Statistics Canada, the rural regions are further divided into three subcategories based on whether or not they are adjacent to a metropolitan area or are in northern regions³.

In 1998-1999, the predominantly urban regions had the highest growth (11.1 per thousand), followed by intermediate regions (9.3) and rural regions adjacent to metropolitan areas (7.2). Rural regions not adjacent to metropolitan areas and rural regions in the north had declines in their populations.

Total growth can be broken down into four elements: natural increase and three types of net migration: (i) international, (ii) interprovincial and (iii) intraprovincial. The sum of these four elements represents total growth (Chart 4).

2 The three categories of regions are defined according to the proportion of the population residing in rural communities.

A community is defined as rural if its population density is less than 150 individuals per square kilometre and urban if the latter is equal to or higher than that value. In Canada, the census consolidated subdivision (CCSD) constitutes a basic community.

A CD is classified as:

- "predominantly urban" if less than 15% of its population resides in rural communities or if it includes one CCSD of over 300,000 inhabitants. This category includes the CDs of Victoria, Vancouver, Edmonton, Calgary, Winnipeg, Toronto, Hamilton, Ottawa-Hull, Montreal, Quebec City and St. John (N.B.).
- "intermediate" if between 15% and 50% of its population resides in rural communities. Regina, Saskatoon, Halifax and St. John's (Nfld.) are examples. Most of the remaining CDs in this category are in Ontario and Quebec.
- "rural" if over 50% of its population resides in rural communities.

For more information about this classification, see OECD, "Creating Rural Indicators for Shaping Territorial Policy", Paris, 1994.

3 See list of CDs by type of region on page 16.

À l'aide d'une typologie proposée par l'OCDE², les 288 DR du Canada peuvent être classées en trois types principaux de région : (i) essentiellement urbanisées, (ii) intermédiaires et (iii) essentiellement rurales. De plus, à Statistique Canada, on subdivise en trois sous-catégories les régions rurales selon qu'elles sont voisines ou non à des régions métropolitaines ou qu'elles sont du Nord³.

En 1998-1999, les régions essentiellement urbanisées ont connu la croissance la plus élevée (11,1 pour 1 000), suivies par les régions intermédiaires (9,3) et les régions rurales voisines des régions métropolitaines (7,2). Les régions rurales non voisines des régions métropolitaines et les régions rurales du Nord ont connu un déclin de leur population.

L'accroissement total peut être désagrégé en quatre éléments: l'accroissement naturel et trois types de soldes migratoires: (i) international, (ii) interprovincial et (iii) infraprovincial. La somme des quatre éléments correspond à l'accroissement total (graphique 4).

2 Les trois catégories de régions sont définies en fonction de la proportion de la population qui vit dans des communautés rurales.

Une communauté est définie comme rurale si sa densité de population est de moins de 150 personnes au kilomètre carré et urbaine si elle est égale ou supérieure à cette valeur. Au Canada, la subdivision consolidée de recensement (SDCR) correspond à une communauté élémentaire.

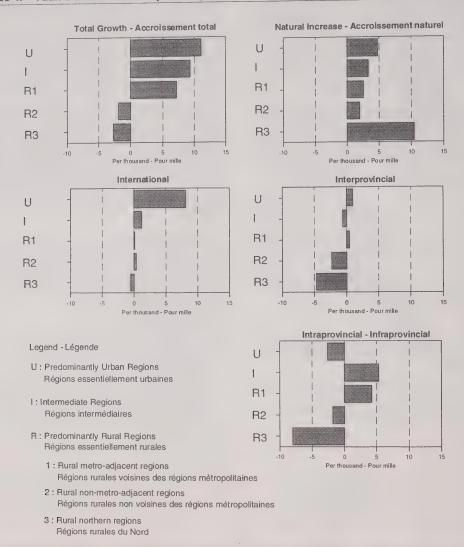

Une DR est classée comme :

- « essentiellement urbanisée » si moins de 15 % de sa population vit dans des communautés rurales ou comprend une SDCR de plus de 300 000 habitants. La catégorie comprend les DR de Greater Vancouver, Edmonton, Calgary, Winnipeg, Toronto Metropolitan, Ottawa-Carleton, Montréal, Québec et St-John (N.-B.);
- « intermédiaire », si entre 15 % et 50 % de sa population vit dans des communautés rurales. Régina, Saskatoon, Halifax et St-John's (T.-N.) en sont des exemples. La plupart des autres DR classées dans cette catégorie se trouvent en Ontario et au Québec;
- « rurale » si plus de 50 % de sa population vit dans des communautés rurales.

Pour de plus amples informations au sujet de cette classification, voir : OECD, « Creating Rural Indicators for Shaping Territorial Policy », Paris, 1994.

3 Voir la liste des DR par type de région à la page 16.

Chart 4. Growth Rate by Component and Type of Region, Canada, 1998-1999
Graphique 4. Taux d'accroissement par composante et type de région, 1998-1999

Source: Demography Division, Demographic Estimates Section. – Division de la démographie, Section des estimations démographiques.

Net international migration is the main factor that explains why the predominantly urban regions experienced the highest growth. These regions also had the highest rate of natural increase, second only to the northern regions. To a much lesser degree, their growth was also due to positive net interprovincial migration.

Le solde migratoire international est le principal facteur qui explique que les régions essentiellement urbanisées connaissent la croissance la plus élevée. Ces régions ont également le taux d'accroissement naturel le plus élevé après celui des régions nordiques. Dans une beaucoup moindre mesure, leur croissance est aussi due à un solde migratoire interprovincial positif.

On the other hand, predominantly urban regions lost through intraprovincial migratory exchanges with intermediate regions and rural regions adjacent to metropolitan areas. The gains through these intraprovincial migratory exchanges were the key growth factor for the latter two types of regions.

Rural regions that are not adjacent to metropolitan areas and rural regions in the north lost in their interprovincial and intraprovincial migratory exchanges. Since natural increase no longer offset those losses, their growth rate was negative.

Age and Gender

A comparison between the age pyramids of the Canadian population at selected years illustrates the ageing of the population. The ageing of the baby boom generations, who were between 35 and 54 years in 2000 and will be between 40 and 59 years in 2005, is clearly shown. The widening of the top of the pyramid, which reflects the growing proportion of elderly, and the narrowing of the base, which represents the declining proportion of youth, are also evidenced.

The ageing of the baby boomers has serious repercussions. This is first noticed on the job market where, as the baby boomers age, the number of experienced workers increases relative to younger ones. Moreover, the oldest baby boomers will soon reach pre-retirement age, while the youngest are still in the middle of their careers. Finally, because of their numbers, the demand for goods and services among baby boomers, which changes as they age, has enormous implications for government and business, which are trying to keep pace.

The population aged 65 and over grew 9.6% between 1995 and 2000, from 3.51 million to 3.85 million, and will increase by 9.3% between 2000 and 2005 if current trends continue. The 80 and over population increased by 16.6% between 1995 and 2000, from 780,000 to

En revanche, les régions essentiellement urbanisées sont perdantes dans leurs échanges migratoires infraprovinciales avec les régions intermédiaires et les régions rurales voisines des régions métropolitaines. Les gains dans ces échanges migratoires infraprovinciales sont le principal facteur de croissance de ces deux types de régions.

Les régions rurales non voisines des régions métropolitaines et celles du Nord sont perdantes dans leurs échanges migratoires autant interprovinciaux qu'infraprovinciaux. Comme leur accroissement naturel ne compense plus pour ces pertes, elles se retrouvent avec un accroissement total négatif.

Âge et Sexe

La superposition des pyramides des âges de la population canadienne à différentes années permet d'illustrer le vieillissement démographique. La progression en âge des générations du baby-boom, qui avaient entre 35 et 54 ans en 2000 et qui auront entre 40 et 59 ans en 2005, y apparaît clairement. L'élargissement du sommet de la pyramide, qui reflète l'augmentation de la proportion des personnes âgées, et le rétrécissement de la base, celui de la diminution de la proportion des jeunes, ressortent aussi clairement.

Le vieillissement des générations du baby-boom a des répercussions importantes. Cela se fait sentir d'abord sur le marché de l'emploi où, à mesure que les « baby boomers » vieillissent, le nombre de travailleurs d'expérience augmente relativement à celui des jeunes. Par ailleurs, les générations les plus âgées du baby-boom arriveront sous peu à la préretraite alors que les plus jeunes sont encore à la mi-carrière. Enfin, à cause de leur importance numérique, la demande en produits et services des « baby-boomers », qui évolue en fonction de leur âge, a des répercussions profondes sur les gouvernements et les entreprises qui doivent s'y adapter.

La population des 65 ans et plus a augmenté de 9,6 % entre 1995 et 2000, passant de 3,51 millions à 3,85 millions, et augmenterait de 9,3 % entre 2000 et 2005, si les tendances actuelles se maintenaient. La population des 80 ans et plus, quant à elle, a augmenté de 16,6 %

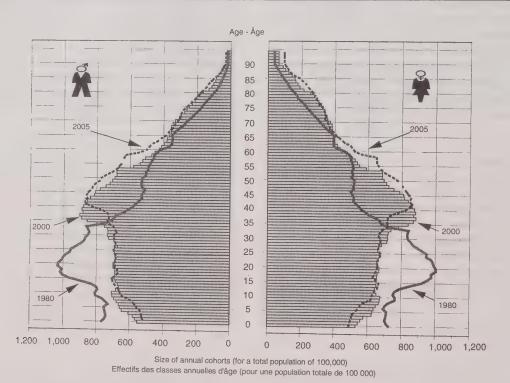

910,000, and could grow by 25.8% during the next 5-year period to reach 1.15 million in 2005. These strong increases in the highest age group will certainly have significant implications for the health system.

Interestingly, the highest growth rate in the old (65 years and over) and very old (80 years and over) population is found in the territories. This is true for both the 1995-2000 period and the next. However, the population in these age groups is relatively small and represents only a small proportion of the population of the territories. Among the provinces, the four most populous posted the strongest growth in the old and very old population.

entre 1995 et 2000, de 780 000 à 910 000, et pourrait s'accroître de 25,8 % au cours du lustre suivant, pour atteindre 1,15 million en 2005. Ces fortes hausses dans le groupe d'âge le plus élevé, ont, bien sûr, des répercussions importantes sur le système de santé.

Fait intéressant, c'est dans les territoires qu'on retrouve la croissance la plus rapide de l'effectif des personnes âgées (65 ans et plus) et très âgées (80 ans et plus), autant au cours de la période 1995-2000 qu'au lustre suivant. Cependant, les populations de ces âges sont relativement petites et ne représentent qu'une faible proportion de la population des territoires. Parmi les provinces, ce sont les quatre plus populeuses qui affichent la croissance la plus forte de l'effectif des personnes âgées et très âgées.

Chart 5. Age Pyramid of the Population of Canada, July 1, 1980, 2000 and 2005
Graphique 5. Pyramide des âges de la population du Canada au 1^{er} juillet 1980, 2000 et 2005

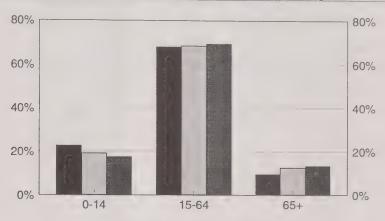

Source: CD-ROM, files as7196.xls and as9605.xls. - CD-ROM, fichiers as7196.xls et as9605.xls.

At the bottom of the pyramid, the population under age 15 is decreasing. It dropped 1.8% between 1995 and 2000, when it reached 5.87 million, and could drop another 4.3% between 2000 and 2005. This has short-term implications for the education system, in which enrolment is gradually declining.

À la base de la pyramide, la population des moins de 15 ans est en réduction. Elle a diminué de 1,8 % entre 1995 et 2000, où elle atteignait 5,87 millions, et pourrait chuter de 4,3 % entre 2000 et 2005. Cette diminution a des répercussions à court terme surtout sur le système scolaire qui voit sa clientèle se réduire progressivement.

Chart 6. Distribution of Population by Broad Age Group and Sex, Canada, July 1, 1980, 2000 and 2005 Graphique 6. Répartition de la population par grand groupe d'âge, Canada au 1^{er} juillet,1980, 2000 et 2005

Broad Age Group - Grand groupe d'âge

■ 1980 □ 2000 ■ 2005

Source: Statistical Table 1.16. - Tableau statistique 1.16.

There are, however, considerable provincial differences in the rate of decline for the population aged 0-14. During the 1995-2000 period, it declined in all provinces and territories except Ontario, Alberta and Nunavut. It had dropped by more than 5% in the four Atlantic provinces (down 18% in Newfoundland), Quebec, Saskatchewan and the Yukon. Based on a fertility assumption of 1.48 births per woman for the 2001-2005 period, all provinces and territories would experience a decline in their population under age 15, and for four of them, Newfoundland, Nova Scotia, New Brunswick and Saskatchewan, this decrease could be more than 10%.

Il existe, cependant, des différences provinciales très importantes dans le rythme de déclin de la population des 0-14 ans. Au cours de la période 1995-2000, le nombre de jeunes a décliné dans toutes les provinces et territoires, sauf en Ontario, en Alberta et au Nunavut. Il avait diminué de plus de 5 % dans les quatre provinces de l'Atlantique (une baisse de 18 % à Terre-Neuve), au Québec, en Saskatchewan ainsi qu'au Yukon. Selon l'hypothèse de fécondité de 1.48 enfant par femme pour la période 2001-2005, toutes les provinces et territoires connaîtraient un déclin de leurs effectifs de moins de 15 ans, et pour quatre d'entre elles, soit Terre-Neuve, la Nouvelle-Écosse, le Nouveau-Brunswick Saskatchewan, le déclin pourrait être supérieur à 10 %.

Statistical Tables - Tableaux statistiques

FOOTNOTES

- 1 Period from July 1 to June 30.
- 2 Residual deviation is obtained by distributing the closure error linearly throughout the intercensal period. For detail, see Section A.1.4 of the Methodological Appendix.
- Prior to 1996, the number of total emigrants is obtained by subtracting the number of returning emigrants from the number of permanent emigrants. After 1996, changes in the number of persons temporarily abroad are also taken into account.
- Figures subsequent to July 1, 2000 are projections obtained by making assumptions for each component of demographic growth. For details, see Section D of the Methodological Appendix.
- 5 Age at the beginning of the period.
- 6 Based on geographical boundaries as delineated in the 1996 Census.
- 7 Total postcensal population estimates for CDs and CMAs in Quebec and British Columbia were prepared by ISQ and BC STATS, respectively. Estimates for Quebec were based on statistics derived from the registration file for, insured people of the "Régie de l'assurance-maladie". Estimates for British Columbia were produced using a regression model based on residential electrical (hydro) connections and Old Age Security data. These estimates were controlled to Statistics Canada provincial estimates.
- 8 Estimates are based on the rates of growth method.
- 9 From 1991 on, Nunavut's population is estimated separately from that of the Northwest Territories.
- 10 These estimates are based on the Child Tax Benefit file from Canada Customs and Revenue Agency (CCRA) weighted to account for migration of other census families which do not receive this benefit or that do not have any children
- 11 Data are final unless otherwise indicated.

RENVOIS

- 1 Période allant du 1^{er} juillet au 30 juin.
- 2 L'écart résiduel est obtenu en répartissant l'erreur en fin de période de façon linéaire au cours de la période intercensitaire. Pour plus de détails, voir la section A.1.4 de l'appendice méthodologique.
- 3 Avant 1996, le nombre d'émigrants totaux est calculé en soustrayant le nombre d'émigrants de retour de celui des émigrants permanents. Après 1996, on tient également compte des changements dans le nombre de personnes temporairement à l'étranger.
- 4 Les données de la période après le 1^{er} juillet 2000 sont des projections obtenues au moyen d'hypothèses pour chacune des composantes démographiques. Pour plus de détails, voir la section D de l'appendice méthodologique.
- 5 Âge au début de la période.
- 6 Selon le découpage géographique en vigueur lors du recensement de 1996.
- Tes estimations postcensitaires de la population totale des DR et des RMR du Québec et de la Colombie-Britannique ont été préparées par l'ISQ et BC STATS respectivement. Les estimations du Québec proviennent de statistiques tirées du Fichier d'inscription des personnes assurées par la Régie de l'assurance-maladie. Celles de la Colombie-Britannique sont produites à l'aide d'un modèle de régression utilisant les statistiques des services d'électricité résidentielle et de la Sécurité de la vieillesse. Ces estimations sont rajustées à l'estimation provinciale de Statistique Canada.
- 8 Estimations obtenues par la méthode des taux de croissance.
- 9 À partir de 1991, la population du Nunavut est estimée séparément de celle des Territoires du Nord-Ouest.
- 10 Ces estimations sont établies à partir du fichier de l'Agence des douanes et du revenu du Canada (ADRC), prestations fiscales pour enfants, pondérées pour tenir compte des autres familles migrantes de recensement qui ne reçoivent aucune prestation, ou qui n'ont pas d'enfant.
- 11 À moins d'indication contraire, les données sont définitives.

FOOTNOTES - concluded

- 12 Includes births under 15 years and 50 years and over in age groups 15-19 and 45-49, respectively.
- 13 Includes only marriages under age 50.
- 14 The sum of Canada excludes the territories
- Although the number of married males and females should be theoretically identical, it is not the case as can be seen in the 1996 Census data which shows 6,786,360 married males and 6,781,110 married females. The main reasons for this discrepancy (5,250) are error responses in the census and international migration. Between July 1, 1991 and June 30, 1996, 256,582 married males and 292,690 married females arrived in Canada as landed immigrants. In response to the question on marital status, some married persons absent from home may have declared themselves as single while their spouse reported their marital status as married.
- 16 From 1996 on, families in Nunavut were estimated separately from those of Northwest Territories.

RENVOIS - fin

- 12 Inclut les naissances de moins de 15 ans et de 50 ans et plus dans les groupes d'âges 15-19 et 45-49, respectivement.
- 13 Ne tient compte que des mariages avant 50 ans.
- 14 La somme pour le Canada exclu les territoires.
- Bien que, théoriquement, le nombre de personnes mariées doit être identique pour chacun des sexes, il n'en est pas ainsi comme on peut le constater au recensement de 1996 (6 786 360 hommes mariées et 6 781 110 femmes mariées). Les principales raisons de cette différence (5 250) sont les erreurs de réponses au recensement et la migration internationale. À la question traitant de l'état matrimonial, certaines personnes mariées absentes de la maison ont pu se déclarer célibataires tandis que leurs conjoints à la maison ont indiqué qu'ils étaient mariés. Du 1^{er} juillet 1991 au 30 juin 1996, 256 582 hommes mariés et 292 690 femmes mariées sont entrés au Canada comme immigrants reçus.
- À partir de 1996, les familles du Nunavut sont estimées séparément de celles des Terrritoires du Nord-Ouest.

WHAT IF there were a place that could save you and your business time and money by offering a consolidated area with the latest in Canadian statistics?

WHAT IF there were a place that offered accessible and reliable data on an assortment of current hot topics on Canadian social and economic themes?

WHAT IF there were a place where analysis experts that know your markets could provide you with advice and customized data at your fingertips?

WHAT IF there were such a place?

THERE IS SUCH A PLACE.

QUE DIRIEZ-VOUS de trouver au même endroit tout ce qu'il y a de plus récent en statistiques canadiennes et, du même coup, de réaliser une économie de temps et d'argent pour vous et votre entreprise?

QUE DIRIEZ-VOUS d'un endroit où scraient mises à votre portée des données fiables sur tout un éventail de sujets brûlants d'actualité du domaine social et économique canadien?

QUE DIRIEZ-VOUS d'un endroit où, en appuyant simplement sur quelques touches, vous auriez accès à des conseils et des données sur mesure, fournis par des analystes bien au courant des marchés auxquels vous vous intéressez?

QUEDIRIEZ-VOUS si un tel endroit existait?

EH BIEN, IL EXISTE!

CONÇU POUR LES AFFAIRES

La source officielle de statistiques canadiennes en un endroit et en tout temps

The official source of Canadian statistics
All the time — All in one place

ociety is changing rapidly. It's a constant challenge for you to stay informed about the important social issues and trends affecting us all. *Canadian Social Trends* helps you meet that challenge successfully by bringing you dynamic and invaluable social analysis in a clear, concise and highly readable format.

Each issue of this popular Statistics Canada quarterly brings key elements of Canadian life into the spotlight—labour markets, immigration, evolving family structure, standard of living. The easy-to-read articles draw from a wide range of demographic, social and economic data sources. Tables and charts highlight key points. A Social Indicators table tracks change.

Social science professionals, researchers, business and policy analysts, educators, students and the general public rely on *Ganadian Social Trends*. Subscribing today will help you keep abreast of change, evaluate social conditions, plan programs or services, and much more!

Visit the "In-Depth" section of our Web site at www.statcan.ca to view some recent articles.

Subscribe today! You won't want to miss a single issue!

Only \$36 annually! In Canada, please add either GST and applicable PST or HST Shipping charges: No shipping charges for delivery in Canada. For shipments to the United States, please add \$24. For shipments to other countries, please add \$40. To order Canadian Social Trands (Cat. No. 11-008-XPE), write to Statistics Canada, Dissemination Division, Circulation Management, 120 Parkdale Avenue, Ottawa, Ontario, KIA 076, Canada, or contact the nearest Statistics Canada Regional Reference Centre listed in this publication. If more convenient, fax your order to 1 377 287-4369, call 1 800 267-6677 or send an e-mail to order@statean.ca. Subscribe on our Web site to the downloadable version of Canadian Social Trands (Cat. No. 11-008-XIE) for only \$27 (plus taxes, where applicable). URL: www.statean.ca/cgi-bin/downpub/feepub.egi

a société évolue rapidement. Et vous devez constamment chercher à demeurer au fait des questions et des tendances sociales importantes qui touchent chacun de nous. **Tendances sociales canadiennes** vous aide à relever ce défi avec succès en vous présentant une analyse sociale à la fois dynamique et d'une valeur inestimable dans un texte clair, concis et fort compréhensible.

Chaque numéro de ce populaire trimestriel de Statistique Canada s'intéresse à des éléments clés de la vie canadienne tels que : marchés du travail, immigration, structure familiale en évolution, niveau de vie. De lecture facile, les articles qu'on y trouve puisent dans une foule de sources de données démographiques, sociales et économiques. Des tableaux et des graphiques en illustrent les points saillants. Un tableau des indicateurs sociaux permet de suivre l'évolution des choses.

Les professionnels des sciences sociales, les chercheurs, les analystes du monde des affaires et des politiques, les enseignants, les étudiants et le grand public se fient à **Tendances sociales canadiennes**. Vous abonner aujourd'hui vous aidera à rester à la fine pointe du changement, à évaluer la conjoncture sociale, à planifier des programmes ou des services, et plus encore!

Visitez la section « En profondeur » de notre site Web à **www.statcan.ca** pour consulter certains des articles publiés récemment.

Abonnex-vous aujourd'hui! Yous ne saurez vous passor d'un seul numéro!

Seulement 36 % par année! Au Canada, veuillez ajouter soit la TPS et la TVP en vigueur, soit la TVH. Frais de port : Aucuns frais pour les envois au Canada. Pour les envois à destination des États-Unis, veuillez ajouter 40 %. THE STATISTICS CANADA EARLY MORNING START-UP SPECIAL

Every morning at 8:30 a.m., Monday to Friday, Internet users can display the day's top socio-economic data simply by selecting *Daily News* on Statistic Canada's Web site at www.statcan.ca. There is no charge for this service.

The Datly is an early-bird review of the latest official data and information released by Statistics Canada. Key economic indicators like employment rates and the Consumer Price Index, in addition to a wide range of business-related information, make The Datly the #1 choice for business people who want to keep upto-date on the country's most important economic developments ... as they happen. It is also the best source for concise briefs on the state of the economy and Canadian society in general.

HERE'S JUST A TASTE OF WHAT YOU'LL FIND AT OUR SITE:

- gross domestic product
- income characteristics
- household information
- population statistics
- motor vehicle sales
- fuel prices
- international tradeagricultural data
- agricultural trata
- employment rates
- consumer price indexes
- international transactions in securities
- census data

investment

- wholesale and retail trade
- national accounts and balance of payments
- shipments
- travel statistics
- construction
- manufacturing
 - ... and more

FIND OUT WHY JOURNALISTS ACROSS CANADA ACCESS THE DAILY EVERY WORKING DAY

The media has long relied on *The Daily* for the information contained in many of the news reports Canadians read or listen to on a regular basis. Now you, too, can link up to this same information quickly and conveniently. What's more, *The Daily* will keep you tuned to the timing and delivery of major Statistics Canada releases and the arrival of our newest products and services.

So, pull up a chair and visit us at our Web site soon. We want your day to get off to the right start.

POUR PARTIR DU BON PIED : **LE QUOTIDIEN** DE STATISTIQUE CANADA

- statistiques sur la
- population

 ventes de véhicules
 automobiles
- prix du carburant
- commerce international
 données sur
- odonnees sur l'agriculture
- taux d'emploi
- indices des prix à la consommation

Dès 8 h 30, du lundi au vendredi, les utilisateurs d'Internet peuvent consulter les principales données socioéconomiques de la journée en accédant aux *Nouvelles du Quotidien* sur le site Web de Statistique Canada à www.statcan.ca. Le service est gratuit.

Le Quotidien permet un survol rapide des plus récentes données et analyses officielles que diffuse Statistique Canada. Des indicateurs économiques clés tels que les taux d'emploi et les indices des prix à la consommation, auxquels s'ajoute l'éventail des données sur l'activité commerciale, font du Quotidien le choix idéal pour les gens d'affaires qui souhaitent être informés des faits saillants de l'économie... dès qu'ils surviennent. C'est aussi la source par excellence de résumés succincts sur l'état de l'économie et de la société canadienne en général.

VOICI UN APERÇU DU CONTENU :

- produit intérieur brut
- caractéristiques du revenu
- renseignements sur les ménages opérations internationales en valeurs mobilières données de recensement données sur les investissements commerce de gros et de détail comptes nationaux et balance des paiements livraisons manufacturières statistiques des voyages construction

fabrication ... et plus

VOYEZ POURQUOI, PARTOUT AU PAYS, LES JOURNALISTES LISENT *LE QUOTIDIEN* CHAQUE JOUR OUVRABLE

Depuis longtemps, les médias puisent dans *Le Quotidien* l'information qui alimente un bon nombre de reportages que les Canadiens lisent ou entendent régulièrement. Désormais, vous aussi pouvez y accéder rapidement et en temps utile. *Le Quotidien* vous informera de l'heure et de la parution des principaux communiqués de Statistique Canada et de l'arrivée de nos plus récents produits et services.

Methodological Appendix

This appendix describes the concepts, data sources and methodology used to produce the demographic estimates and projections included in this publication and CD-ROM. For more details, the reader is invited to consult the documents listed in the reference section.

A.1 Population Estimates

A.1.1 Types of Estimates

Demographic estimates can be categorised as either intercensal or postcensal. Intercensal estimates correspond to estimates between censuses, whereas postcensal estimates correspond to non-census years after the most recent census. In producing up-to-date figures, postcensal estimates are obviously more timely (as there is no need to wait until the release of the next census), albeit less accurate. The production of intercensal estimates involves the retrospective adjustment of past figures with the availability of new census data.

Because some data are only available several months after the reference date, three types of postcensal estimates are issued, preliminary (PP); updated (PR), and final (PD). Reference dates and time lags associated with the availability of the three types of estimates are typically released within three to four months after the reference date for preliminary data. while final estimates normally take 2-3 years to complete. The quality of population estimates ultimately depends upon the availability of several different administrative data files that are provided to Statistics Canada from other government departments, both in Canada and internationally. The production of three successive series of postcensal estimates, while sometimes confusing to users of demographic statistics, is the strategy that best satisfies the need for both timeliness and accuracy. All tables in the current publication, as well as on the corresponding CD-ROM, indicate the degree of finalisation of the enclosed figures.

Appendice méthodologique

Le présent appendice décrit les concepts, les sources de données et les méthodes utilisées pour produire les estimations et les projections démographiques qui figurent dans la présente publication et le CD-ROM. Pour plus de renseignements, le lecteur est invité à consulter les documents de la liste bibliographique.

A.1 Estimations de population

A.1.1 Catégories d'estimations

estimations démographiques être Les peuvent intercensitaires ou postcensitaires. Les estimations intercensitaires sont produites à l'aide de deux recensements, tandis que les estimations postcensitaires sont produites à partir du plus récent recensement. Du point de vue de l'actualité des données, les estimations postcensitaires sont manifestement plus à jour que celles du dernier recensement, mais elles sont moins précises. La production d'estimations intercensitaires consiste à corriger rétrospectivement les estimations postcensitaires à l'aide des données d'un nouveau recensement.

Puisque certaines données ne sont disponibles que plusieurs mois après la date de référence, trois types d'estimations postcensitaires sont produites. Celles-ci peuvent être provisoires (PP), mises à jour (PR) ou définitives (PD). Le délai entre la date de référence et la disponibilité des estimations est de trois à quatre mois pour les provisoires et de deux à trois ans pour les définitives. La qualité des estimations de population dépend de l'accès à plusieurs fichiers de données administratives mis à la disposition de Statistique Canada par divers ministères canadiens et étrangers. Bien qu'elle occasionne parfois de la confusion chez les utilisateurs, la production de trois séries successives de données permet de concilier l'actualité et la qualité des estimations. Tous les tableaux de la présente publication et du CD-ROM précisent le degré de finalisation des statistiques qu'ils contiennent.

A.1.2. Postcensal Population Estimates

Postcensal estimates are obtained by adding the number of births, subtracting the number of deaths and by adding or subtracting the net impact of international and internal migration on the most recent census population adjusted for census coverage error (i.e. both census undercount and census overcount). The inclusion of non-permanent residents in the target population dictates that net change in the size of this subpopulation in Canada be added or subtracted from the base period.

Estimates of population are first produced for each province and territory, and then summed to obtain an estimate of the population of Canada.

The method used in estimating total provincial/ territorial populations is expressed as follows:

A.1.2. Estimations postcensitaires

Pour le calcul des estimations postcensitaires, on ajoute ou retranche à l'effectif de population le plus récent, corrigé de l'erreur de couverture au recensement (c.-à-d. le sous-dénombrement et le surdénombrement) le nombre de naissances, le nombre de décès et les composantes migratoires internes et internationales. Le fait d'inclure les résidents non permanents dans la population cible oblige à ajouter à la population de départ, ou à en soustraire, la variation nette de la taille de cette sous-population .

Les estimations sont d'abord produites pour chaque province et territoire, puis totalisées pour obtenir une estimation de la population du Canada.

L'équation de la méthode des composantes pour estimer la population totale des provinces ou territoires est la suivante :

$$P_{(t+i)} = P_t + B_{(t,t+i)} - D_{(t,t+i)} + I_{(t,t+i)} - E_{(t,t+i)} + NPR_{(t,t+i)} + N_{(t,t+i)}$$

| where for a | ny gi | ven province and territory: | où, pour ch | aque | province et territoire : |
|------------------------|-------|--|------------------------|------|--|
| $P_{(t+i)}$ | = | estimate of population at time t+i; | $P_{(t+i)}$ | = | estimation de la population au temps t+i; |
| Pt | = | base population at time t (current census adjusted for net undercount or most recent estimates); | P _t | = | population de départ t (recensement rajusté pour le sous-dénombrement net ou estimations plus récentes); |
| $B_{(t,t+i)}$ | = | number of births between time t and t+i; | $B_{(t,t+i)}$ | = | nombre de naissances entre les temps t et t+i; |
| $D_{(t,t+i)}$ | = | number of deaths between time t and t+i; | $D_{(t,t+i)}$ | = | nombre de décès entre les temps t et t+i; |
| $I_{(t,t+i)}$ | = | number of immigrants between time t and t+i; | $I_{(t,t+i)}$ | = | nombre d'immigrants entre les temps t et t+i; |
| $E_{(t,t+i)}$ | = | number of total emigrants between time t and t+i; | $E_{(t,t+i)}$ | = | nombre d'émigrants totaux entre les temps t et t+i; |
| NPR _(t,t+i) | = | net change in the number of non- permanent residents between time t and t+i; | NPR _(t,t+i) | | variation nette du nombre de résidents non permanents entre les temps t et t+i; |

 $N_{(t,t+i)}$ = net interprovincial migration between time t and t+i:

(t,t+i) = interval between the date of the base population and the reference date of the estimate.

Postcensal estimates of population by age and sex are produced following essentially the same approach but applied to each age and sex cohort in the population.

A.1.3 Postcensal Estimates of Population for Census Metropolitan Areas and Census Divisions

At lower levels of geographical disaggregation (census divisions and census metropolitan areas), the component approach is also used but figures are adjusted, if necessary, to assure consistency with provincial/territorial totals.

A proration procedure is used to adjust total population counts and the components of census divisions and census metropolitan areas. Proration merely implies that the difference between the sum of subprovincial areas and the total population for a province be distributed proportionally across subprovincial areas.

Two-way raking* is an iterative procedure whereby differences are alternatively adjusted in assuring a consistency between (i) the sum of subprovincial areas and provincial/territorial population totals, and (ii) the sum across subprovincial areas for specific age/sex categories and the provincial/territorial distribution by age and sex. Thus, this method ensures the consistency between census divisions and census metropolitan areas, and provincial/territorial estimates by age and sex.

 $N_{(t,t+i)}$ = migration interprovinciale nette entre les temps t et t+i;

(t,t+i) = intervalle entre la date de référence de l'effectif de départ et celle de l'estimation.

Afin de produire des estimations postcensitaires par âge et sexe, on utilise la même méthode à la différence qu'elle est appliquée à chaque cohorte d'âge et sexe de la population de départ.

A.1.3 Estimations postcensitaires de la population des régions métropolitaines de recensement et des divisions de recensement

Afin de produire des estimations au niveau des divisions de recensement et des régions métropolitaines de recensement, on utilise également la méthode des composantes. Ces estimations sont corrigées, au besoin, afin d'assurer la concordance avec les totaux provinciaux ou territoriaux.

La méthode de répartition proportionnelle est utilisée pour corriger les effectifs totaux et les composantes des divisions de recensement et des régions métropolitaines de recensement. La répartition proportionnelle sous-entend simplement que la différence entre la somme des populations des régions infraprovinciales et la population de la province est répartie proportionnellement entre les régions infraprovinciales.

La méthode itérative bidimensionnelle* permet de corriger simultanément les différences entre i) la somme des populations des régions infraprovinciales et la population provinciale ou territoriale et ii) la somme des populations des régions infraprovinciales d'un âge et sexe donné et l'effectif provinciale ou territoriale au même âge et sexe. Cette méthode permet ainsi d'assurer la concordance entre les estimations des divisions de recensement et des régions métropolitaines de recensement, et les estimations provinciales et territoriales par âge et sexe.

Two-way raking has also alternatively been referred to as the "Deming method" and the "method of iterative proportions" (see Shryock, Siegel et al, 1976;547-549).

On donne aussi à cette méthode les noms de « méthode Deming » et « méthode d'ajustement proportionnel itératif » (voir Shryock, Siegel et coll., 1976:547-549).

Since most components for the last reference year are not yet available, preliminary estimates for subprovincial areas are generated using the rate of growth method. The total population for each subprovincial area is calculated by assuming a continuation of the geometric growth rate as calculated over the previous two-year period.

The age/sex distribution is obtained by adding the same number of births as witnessed over the latest final estimates, and subtracting the exact same number of deaths, as distributed by age and sex. The aforementioned prorating and raking procedures are then used in controlling up preliminary estimates for subprovincial areas to more accurate provincial/territorial figures.

As an exception to the above methodology, the preliminary estimates for subprovincial areas in Quebec and in British Columbia were prepared by their respective statistics agencies. ISQ (Institut de la statistique du Québec) estimates are based on statistics derived from the registration file for insured people of the "Régie de l'assurance-maladie". BC STATS estimates are produced using a regression model based on residential electrical (Hydro) connections and Old Age Security data as symptomatic indicators. These estimates are controlled to Statistics Canada provincial estimates.

The July 1, 2000 census metropolitan area population estimates were obtained by converting the population estimates by census division, using conversion factors.

A.1.4 Intercensal Estimates

Following each census, intercensal estimates are produced (i.e. estimates of population for reference dates between censuses). These estimates reconcile previous postcensal estimates with the new census-based information.

Comme la plupart des composantes de la dernière année de référence ne sont pas encore disponibles, les estimations provisoires des régions infraprovinciales sont produites à l'aide de la méthode du taux de croissance. Pour chaque région, on calcul un taux de croissance démographique moyen de la population totale selon la croissances des deux dernières années en supposant que la population suit une progression géométrique.

La répartition par âge et sexe est obtenue par le calcul suivant. En utilisant le même nombre de naissances que celui de l'année précédente et en soustrayant le même nombre de décès par âge et sexe à la dernière estimation définitive, on applique la méthode de répartition proportionnelle afin que les populations des régions infraprovinciales par âge et sexe correspondent aux répartitions provinciales et territoriales.

Une méthode différente a été employée pour les estimations provisoires du Québec et de la Colombie-Britannique. Elles ont été préparées par leur agence statistique respective. Les estimations de l'Institut de la statistique du Québec (ISQ) proviennent des statistiques tirées du fichier d'inscription des personnes assurées par la Régie de l'assurance-maladie. Celles de «BC STATS» sont produites au moyen d'un modèle de régression utilisant des données provenant des services d'électricité résidentiels et de la Sécurité de la vieillesse comme indicateurs symptomatiques. Ces estimations sont rajustées à l'estimation provinciale de Statistique Canada.

Afin d'obtenir les estimations de population pour l'année 2000 des régions métropolitaines de recensement, on a appliqué des facteurs de conversion aux estimations par divisions de recensement.

A.1.4 Estimations intercensitaires

Après chaque recensement, on produit des estimations intercensitaires (c.-à-d. des estimations de population pour des dates de référence comprises entre deux recensements). Ces estimations permettent d'assurer une cohérence entre les estimations postcensitaires antérieures et les nouvelles données de recensement.

The production of intercensal estimates involves two basic steps:

- (i) the calculation of the error of closure;
- (ii) the distribution of the error of closure by intercensal year.

The error of closure is defined as the difference between the enumerated population of the most recent census (after adjustments for census coverage error) and the most current set of postcensal population estimate (for census day). In assuming that the coverage studies that follow each enumeration are unbiased, the adjusted census figures are accepted as true.

Assuming that the error of closure is distributed uniformly over the intercensal period, it is distributed according to an arithmetic function.

The correction of intercensal estimates by age and sex is done similarly by distributing the error of closure across age and sex cohorts.

To produce the intercensal estimates for the 1986-1996 period at the census division and census metropolitan area levels, the 1986 and 1991 base populations and the 1986-1996 components of demographic growth need to be adjusted for 1996 boundaries. This is done by applying conversion factors based on the population of the 1996 Census subdivisions. For most provinces, there were only minor revisions to census divisions and census metropolitan areas. However, changes are more significant for British Columbia where some census divisions have been combined.

When summed, the series of intercensal estimates by age and sex for subprovincial areas, produced by taking the error of closure into account, differ slightly from the intercensal estimates at the provincial/territorial level. These differences are then proportionally distributed among the age/sex cohorts.

La production d'estimations intercensitaires comporte deux étapes principales :

- (i) le calcul de l'erreur en fin de période;
- (ii) la répartition de l'erreur en fin de période par année intercensitaire.

Par « erreur en fin de période », on entend la différence entre la population du recensement le plus récent (corrigé de l'erreur de couverture) et les estimations postcensitaires (au jour du recensement). Si l'on suppose que les études de couverture réalisées après chaque recensement ne sont entachées d'aucune erreur, les chiffres corrigés de recensement sont considérés comme exacts.

En admettant que l'erreur en fin de période est répartie uniformément au cours de la période intercensitaire, celle-ci est distribuée selon une fonction arithmétique.

On corrige les estimations intercensitaires selon l'âge et le sexe de la même façon, c'est-à-dire en répartissant l'erreur en fin de période entre les diverses cohortes d'âge et sexe.

Afin de produire les estimations intercensitaires pour la période 1986 à 1996 aux niveaux des divisions de recensement et des régions métropolitaines de recensement, il faut d'abord convertir les populations de départ de 1986 et 1991 et les composantes de la croissance démographique selon les frontières en vigueur au moment du recensement. On applique ainsi des facteurs établis d'après les subdivisions du recensement de 1996. Dans la plupart des provinces, les corrections apportées aux divisions de recensement et aux régions métropolitaines de recensement sont mineures. Par contre, les changements sont plus importants en Colombie-Britannique où un regroupement de divisions de recensement a été effectué.

La somme des estimations infraprovinciales intercensitaires selon l'âge et le sexe produites en tenant compte de l'erreur en fin de période diffère légèrement des estimations intercensitaires provinciales et territoriales. Les écarts sont alors répartis proportionnellement entre les cohortes d'âge et sexe.

A.2 Components

A.2.1 Base Populations

Each of the six base populations were derived from the 1976 to 1996 Censuses. However, the population counts were collected as follows:

 Adjustment of population by age and sex from Census day to June 1.

Since the 1971 and 1976 Censuses were held on June 1, no adjustment was necessary. The adjustment for the few days between Census day and June 1 in 1981, 1986 and 1991 was made using a proportion of growth method. The adjustment between May 14 (Census day) and July 1 in 1996 was done using the cohort component approach.

- Adjustment of the population for net undercoverage.
- Addition of independent estimates of incompletely enumerated Indian reserves in 1986, 1991 and 1996.
- Adjustment for early enumeration in 1991 and 1996 in parts of northern Quebec, Newfoundland, the Yukon and the Northwest Territories.
- Estimation of the July 1 base population by addition or subtraction of the components of growth for the month of June.
- Addition of estimates of non-permanent residents in 1971, 1976, 1981, and 1986.
 Starting in 1991, non-permanent residents are included in the census universe.

The adjustment for net census undercoverage is particularly important. Net census undercoverage is the difference between the number of persons who

A.2 Composantes

A.2.1 Populations de départ

Les six populations de départ sont issues des recensements de 1971 à 1996. Toutefois, ces populations sont corrigées selon les étapes suivantes :

 Rajustement de la population selon l'âge et le sexe, pour la période allant du jour du recensement au 1^{er} juin.

Comme les recensements de 1971 et de 1976 ont eu lieu le 1^{er} juin, aucun rajustement n'est nécessaire. Le rajustement pour tenir compte des quelques jours entre le jour du recensement et le 1^{er} juin en 1981, 1986 et 1991 est fait par la méthode de l'accroissement proportionnel. Pour 1996, on utilise la méthode des composantes pour faire le rajustement entre le 14 mai (jour du recensement) et le 1^{er} juillet.

- Rajustement de la population pour le sousdénombrement net.
- Addition d'estimations indépendantes de la population partiellement dénombrée des réserves indiennes en 1986, 1991 et 1996.
- Rajustement pour le dénombrement anticipé dans certaines régions du Nord du Québec, de Terre-Neuve, du Yukon et des Territoires du Nord-Ouest en 1991 et en 1996.
- Estimation de la population de départ au 1^{er} juillet par addition ou soustraction des composantes de l'accroissement démographique calculées pour le mois de juin.
- Addition des estimations du nombre de résidents non permanents en 1971, 1976, 1981 et 1986. Depuis 1991, les résidents non permanents font partie de l'univers du recensement.

Le rajustement pour le sous-dénombrement net au recensement est une étape importante. Le sous-dénombrement net correspond à l'écart entre le

should have been enumerated but were missed (undercoverage), and the number of persons who were enumerated but who should not have been or who were counted more than once (overcoverage).

The coverage studies provide estimates of undercoverage of the 1991 and 1996 Censuses at the provincial and territorial level, and of the 1971, 1976, 1981 and 1986 Censuses at the provincial level only. The studies provide estimates of overcoverage at the provincial and territorial level of the 1991 and 1996 Censuses. Overcoverage before 1991 was estimated by assuming that the overcoverage-to-undercoverage ratio observed in each province in 1991 was the same for each census over the 1971-1986 period.

The net undercoverage for the Yukon and the Northwest Territories before 1991 was estimated by assuming that the ratios between the net undercoverage of each territory and the 10 provinces observed in 1991 was the same for each census over the 1971-1986 period.

For consistency's sake, 1991 Census under- and overcoverage were revised to account for the methodological improvements introduced to the coverage studies in 1996.

A mixture of procedures was used to produce the estimates of net undercoverage by sex and single years of age for 1991 and 1996. A curve-smoothing method was used to produce the national estimates by age and sex. An Empirical Bayes regression model created the estimates for broad age groups of each province and a synthetic model generated the single year of age estimates. Finally, a two-way raking ratio procedure was used to ensure that the estimates were consistent with the provincial totals and the national estimates by age and sex.

For the 1971-1986 period, the age and sex estimates were simply prorated to the revised estimates of the total population.

nombre de personnes qui auraient dû être recensées mais ne l'on pas été (sous-dénombrement) et le nombre de personnes qui ont été recensées, mais n'aurait pas dû l'être ou ont été comptées plus d'une fois (surdénombrement).

Les études de couverture fournissent une estimation du sous-dénombrement aux recensements de 1991 et de 1996 aux niveaux provincial et territorial, et au niveau provincial uniquement aux recensements de 1971, 1976, 1981 et 1986. L'estimation du surdénombrement aux niveaux provincial et territorial n'est disponible que pour les recensements de 1991 et 1996. Pour estimer le surdénombrement des recensements précédents, on suppose que le rapport du surdénombrement au sous-dénombrement observé en 1991 est le même que celui survenu à chaque recensement entre 1971 et 1986.

Pour estimer le sous-dénombrement net pour le Yukon et les Territoires du Nord-Ouest avant 1991, on suppose que le rapport entre le sous-dénombrement net pour chaque territoire et les dix provinces observé en 1991 est le même que celui observé à chaque recensement entre 1971 et 1986.

Par souci d'uniformité, on a révisé les estimations du sous-dénombrement et du surdénombrement de 1991 de façon à tenir compte des améliorations méthodologiques apportées aux études de couverture en 1996.

Les estimations du sous-dénombrement net par années d'âge et sexe pour 1991 et 1996 sont issues de l'application de diverses méthodes. Les estimations nationales selon l'âge et le sexe sont d'abord lissées. Un modèle de régression empirique de Bayes permet ensuite de produire les estimations provinciales par grands groupes d'âge et un modèle synthétique permet de calculer les estimations par année d'âge. Enfin, on applique la méthode itérative bidimensionnelle afin de s'assurer que les estimations concordent avec les totaux provinciaux et les estimations nationales par âge et sexe.

Pour la période 1971 à 1986, on rajuste simplement les estimations par âge et sexe proportionnellement aux estimations révisées de la population totale.

Coverage studies do not provide estimates of net undercoverage for census divisions and census metropolitan areas. In order to obtain estimates at subprovincial levels, provincial rates of net undercoverage by single years of age and sex are applied to all geographic regions in the province. Census divisions in the Northwest Territories and Nunavut have been corrected separately following what had been measured by the 1996 coverage studies for each of these territories.

A.2.2 Births and Deaths

Information on births and deaths is derived directly from Statistics Canada's Health Statistics Division database. Although Statistics Canada manages the national system of vital statistics, the central vital statistics registries of the provinces and territories are responsible for collecting the statistics. Provincial and territorial Vital Statistics Acts (or equivalent legislation) render compulsory the registration of all live births and deaths, and all provinces and territories provide this information to Statistics Canada.

The universe associated with vital statistics closely parallels the census universe, in including births and deaths of all Canadians, landed immigrants and non-permanent residents. The current publication includes births and deaths from vital statistics at the provincial and subprovincial level up to 1997. For 1998, births and deaths are derived from preliminary counts by province or territory of occurrence. For 1999 and 2000, births and deaths are estimated using age-specific fertility rates and age and sex-specific mortality rates, except for Quebec, which provided its most recent estimates.

Les études de couverture ne fournissent pas d'estimations du sous-dénombrement net à l'échelle des divisions de recensement et des régions métropolitaines de recensement. Pour obtenir des estimations au niveau infraprovincial, on applique les taux provinciaux de sous-dénombrement net par année d'âge et sexe à chacune des régions de la province. Les données pour les divisions de recensement des Territoires du Nord-Ouest et de Nunavut sont corrigées séparément d'après les données des études de couverture de 1996 pour chacun de ces territoires.

A.2.2 Naissances et décès

Les nombres de naissances et de décès proviennent directement de la base de données de la Division des statistiques sur la santé de Statistique Canada. Statistique Canada gère le Système national de statistiques de l'état civil, mais ce sont les bureaux centraux de la statistique de l'état civil des provinces et des territoires qui sont chargés de recueillir ces statistiques. Aux termes des lois provinciales et territoriales sur la statistique de l'état civil (ou de textes législatifs équivalents), l'enregistrement de toute naissance vivante et de tout décès est obligatoire, et chaque province et territoire fournit ces renseignements à Statistique Canada.

L'univers des statistiques de l'état civil correspond à celui du recensement. Ces univers comprennent les naissances et les décès de l'ensemble des Canadiens, des immigrants reçus et des résidents non permanents. La présente publication contient les statistiques sur les naissances et les décès de l'état civil aux niveaux provincial et infraprovincial jusqu'à 1997. Pour 1998, les naissances et les décès sont estimés à partir des comptes provisoires selon la province ou le territoire d'occurrence. Pour 1999 et 2000, les nombres de naissances et de décès sont estimés à partir des taux de fécondité par âge et des taux de mortalité par âge et sexe, sauf pour le Québec, qui a fourni ses estimations les plus récentes.

A.2.3 Immigration and Non-Permanent Residents

As with births and deaths, legal requirements dictate the collection of information on immigration in Canada (the Immigration Act). Immigration is well documented by Citizenship and Immigration Canada in terms of the number of persons and their characteristics who are granted landed immigrant status by the federal government. A landed immigrant is a person who is not a Canadian citizen by birth, but who has been granted the right to live in Canada permanently by Canadian immigration authorities. Not included among landed immigrants are the very small numbers of persons born abroad to Canadian parents who are only temporarily outside of the country.

A non-permanent resident, as defined by Statistics Canada, is a person who has been granted the right to live in Canada temporarily, and includes persons living in Canada claiming refugee status, persons holding an employment authorisation, student authorisation or Minister's permit. Also included among non-permanent residents are all family members born outside Canada currently sharing a residence with the afore-mentioned persons.

Statistics Canada estimates the number of non-permanent residents from these authorisations and permits. The component method subsequently uses this estimate in the calculation of net change in the size of this sub-population, and the addition or subtraction to or from the base population. The distribution of non-permanent residents at the subprovincial level is derived from the 1996 Census data.

A.2.4 Total Emigration

In the estimation of total emigration, three constituents of emigration are estimated, including: (i) the number of emigrants, (ii) the number of returning emigrants, and (iii) the number of persons temporarily abroad. A variety of techniques and data sources enter into estimating these constituents, that combined, provide for a measure of population loss through emigration.

A.2.3 Immigrants et résidents non permanents

À l'instar des données sur les naissances et les décès, la collecte des statistiques d'immigration au Canada est réglementée (Loi sur l'immigration). Citoyenneté et Immigration Canada fournit des renseignements sur le nombre et les caractéristiques des personnes auxquelles le gouvernement fédéral accorde le statut d'immigrant reçus. Un immigrant reçu est une personne qui n'est pas un citoyen canadien de naissance, mais à qui les autorités canadiennes de l'immigration ont accordé le droit de vivre au Canada en permanence. Le nombre de personnes nées à l'étranger de parents canadiens qui ne séjournent que provisoirement hors du pays n'est pas inclus parmi les immigrants.

Selon la définition de Statistique Canada, un résident non permanent est une personne qui a obtenu le droit de vivre au Canada provisoirement. Cette catégorie inclut les personnes résidant au Canada qui demandent le statut de réfugié, les titulaires d'une autorisation d'emploi, d'une autorisation d'études et d'un permis ministériel. Elle inclut aussi tous les membres de leur famille nés à l'extérieur du Canada qui résident avec elles.

Statistique Canada estime le nombre de résidents non permanents à partir de ces autorisations et permis. Ces estimations permettent de calculer la variation nette de l'effectif des résidents non permanents que l'on ajoute ensuite à la population de départ. La répartition des résidents non permanents au niveau infraprovincial est issue du Recensement de 1996.

A.2.4 Émigration totale

Pour l'estimation de l'émigration totale, nous devons estimer trois sous-composantes de l'émigration, à savoir i) le nombre d'émigrants, ii) le nombre d'émigrants de retour et iii) le nombre de personnes temporairement à l'étranger. Diverses méthodes et sources de données permettent d'estimer ces sous-composantes qui, ensemble, fournissent une mesure du nombre annuel de personnes ayant quitté le pays.

The number of emigrants is measured using statistics from the *Immigration and Naturalization Service (INS)* of the U.S. Department of Justice and administrative data from the federal Child Tax Benefit program (CTB) from the Canada Customs and Revenue Agency (CCRA). The former data source is used in estimating emigration to the United States. In order to estimate emigration to other countries using CTB program statistics, it is necessary to adjust the statistics because the program is not universal and does not provide direct information on the total number of adult emigrants. As a result, three adjustment factors are used to take into account:

- 1. the partial coverage of the program, that is, persons not entitled to the CTB;
- the differential propensity to emigrate of children receiving benefits compared to those not covered; and
- the number of adults emigrating, based on the number of child emigrants.

Since data sources are not available for estimates from 1997-1998 to 1999-2000, the adjusted numbers for 1996-1997 were also used for these years.

A returning emigrant is a person returning to Canada, after having been classified as an emigrant. Again, data from the Child Tax Benefit program (CTB) are used in estimating returning emigrants, in a manner that is analogous to the above procedures. Adjustment factors are introduced to compensate for the absence of universality in the CTB program, as well as child/adult ratios in the estimation of return emigration among adults.

Population estimates now take into account an estimate of net change in the number of persons living temporarily abroad. Data from the Reverse Record Check (RRC), the most important of the Census Coverage Error Studies, are used to estimate the net change in the number of persons living temporarily abroad. In order to produce postcensal estimates,

Pour estimer le nombre d'émigrants, on utilise les statistiques de l'Immigration and Naturalization Service (INS) du U.S. Department of Justice et des données administratives recueillies par le Programme fédéral de prestations fiscales pour enfants (PFE) de l'Agence des douanes et du revenu du Canada (ADRC). La première source permet d'estimer l'émigration vers les États-Unis. Afin d'estimer l'émigration vers les autres pays à l'aide des statistiques du programme PFE, on doit rajuster les statistiques puisque le programme n'est pas universel et ne fournit pas de renseignements directs sur le nombre total d'émigrants adultes. Par conséquent, on applique trois facteurs de rajustement afin de prendre en compte :

- la couverture partielle du programme, c'est-à-dire des personnes qui n'ont pas droit aux PFE;
- 2. la propension différentielle à émigrer des enfants couverts et ceux qui ne le sont pas; et
- 3. le nombre d'adultes qui émigrent, d'après les données sur les enfants émigrants.

Les sources de données n'étant pas disponibles pour les estimations de 1997-1998 à 1999-2000, les nombres rajustés de 1996-1997 ont aussi été utilisés pour ces années.

Un émigrant de retour est une personne qui revient au Canada après avoir été classé dans la catégorie des émigrants. Selon une méthode analogue à celle mentionnée ci-haut, on utilise des données du Programme des prestations fiscales pour enfants (PFE) pour estimer le nombre d'émigrants de retour. On applique à ces données des facteurs de rajustement pour tenir compte de la non-universalité du programme, ainsi que des ratios enfants-adultes afin d'estimer les retours d'émigrants adultes.

Les estimations démographiques tiennent maintenant compte de la variation nette du nombre de personnes qui vivent temporairement à l'étranger. Cette variation est estimée d'après les données de la Contre-vérification des dossiers (CVD), la plus importante des études des erreurs de couverture. Les estimations postcensitaires sont produites en extrapolant les données des CVD de 1991 et

information from the 1991 and 1996 RRC is extrapolated. The 1996 provincial and territorial distribution however, is maintained constant.

A.2.5 Interprovincial Migration

Interprovincial migration represents movements from one province or territory to another, involving a change in usual place of residence. As with emigration, there is no provision for recording interprovincial migration in Canada. Consequently, these movements are estimated using administrative data.

Final estimates of interprovincial migration are obtained by comparing addresses indicated on personal income tax returns over two consecutive tax years. However, the migration status of the taxfilers' dependants is imputed. An adjustment is also required to take into account migrants not filing income tax returns.

Estimates based on income tax returns are not available at the time preliminary estimates are produced. The estimation of preliminary interprovincial migration is derived from the CTB program statistics, which provides counts of migrant children (0 to 17 years) eligible to the program. The data are adjusted for non-eligible children. The number of adult migrants is derived from the number of migrant children and factors calculated from tax data. The distribution by age and sex is obtained from the 1996 Census one-year-mobility question and tax data.

A.2.6 Subprovincial Migration Components

The components (immigration, emigration, interprovincial migration and intraprovincial migration) by broad age group and sex for intraprovincial areas are obtained using tax data. Data by broad age group and sex were distributed by single year of age according to the provincial and territorial distribution of interprovincial migration with the exception of intraprovincial migration which was based on the 1996 Census mobility data.

de 1996. La répartition par province et territoire demeure toutefois constante au niveau de 1996.

A.2.5 Migration interprovinciale

La migration interprovinciale correspond à l'ensemble des déplacements d'une province ou d'un territoire vers un autre qui entraînent un changement du lieu habituel de résidence. Comme pour l'émigration, il n'existe aucune disposition relative à l'enregistrement de la migration interprovinciale au Canada. Ces mouvements doivent donc être estimés à l'aide de données administratives.

Les estimations définitives de la migration interprovinciale sont obtenues en comparant les adresses figurant sur les déclarations de revenus des particuliers de deux années consécutives. La migration des personnes à charge du déclarant doit toutefois être imputée. Enfin, il est nécessaire de rajuster les données pour tenir compte des migrants qui ne produisent pas de déclarations de revenus.

Les estimations issues des déclarations de revenu ne sont pas disponibles au moment de la préparation des estimations provisoires. L'estimation de la migration interprovinciale provisoire provient des statistiques du programme des PFE, desquelles on déduit la migration des enfants (0-17 ans) admissibles au programme. On doit rajuster les données pour tenir compte des enfants non admissibles. L'effectif des adultes migrants est déduit des enfants migrants et de facteurs calculés d'après les données fiscales. La répartition par âge et sexe provient de la question sur la mobilité un an auparavant du Recensement de 1996 et des données fiscales.

A.2.6 Composantes de la migration au niveau infraprovincial

Les composantes immigration, émigration, migration interprovinciale et migration infraprovinciale par grand groupe d'âge et sexe des régions infraprovinciales sont extraites des données fiscales. Les données par grand groupe d'âge et sexe sont réparties par année d'âge selon les répartitions provinciales ou territoriales, sauf pour la migration infraprovinciale qui provient des données de la mobilité du Recensement de 1996.

B. Population Estimates by Marital Status

The population by marital status is comprised of single, married (including common-law), divorced and widowed persons. These estimates are prepared at the national, provincial and territorial levels for the 1986-2000 period. Legal marital status estimates cover the period 1996-2000.

Intercensal estimates by age, sex and marital status are derived from population estimates by age and sex and distributions by age, sex and marital status are those of the 1986 to 1996 Censuses. The census distributions are interpolated and applied to the estimates by age and sex.

The component method is used to produce the postcensal estimates by age, sex and legal marital status. This method takes into account events that result in a change of marital status. Deaths and all migration components by age and sex are distributed by marital status. Marriages and divorces are also taken into account, as well as deaths of married persons thus modifying the marital status of his (her) spouse.

The components of growth were distributed by legal marital status as follows:

- Deaths and marriages using vital statistics;
- Interprovincial migration using the 1996 Census data; the one-year ago mobility question;
- Immigration and non-permanent residents using Citizenship and Immigration Canada data;
- Emigration and persons temporarily abroad using data from the U.S. Department of Justice, Immigration and Naturalization Service;
- Returning emigrants using the 1996 Census distribution:
- Divorces using data from the federal Department of Justice.

B. Estimations de la population par état matrimonial

La population par état matrimonial se compose des personnes célibataires, mariées (y compris union libre), divorcées et veuves. Ces estimations sont préparées au niveau du Canada, des provinces et des territoires pour la période 1986-2000. Les estimations par état matrionial légal ne couvrent que la période 1996-2000.

Les estimations intercensitaires par âge, sexe et état matrimonial sont établies à partir des estimations par âge et sexe et des répartitions par âge, sexe et état matrimonial des recensements de 1986 à 1996. Les répartitions des recensements sont interpolées et appliquées aux estimations par âge et sexe.

La méthode des composantes est utilisée pour préparer les estimations postcensitaires par âge, sexe et état matrimonial légal. Cette méthode tient compte des événements qui occasionnent un changement d'état matrimonial. Les décès et les composantes migratoires par âge et sexe sont répartis par état matrimonial. Les mariages et les divorces sont aussi pris en compte, de même que les décès de personnes mariées, modifiant ainsi l'état matrimonial du conjoint.

Les composantes sont réparties par état matrimonial légal comme suit :

- Les décès et mariages selon les statistiques de l'état civil;
- La migration interprovinciale selon les données sur la mobilité un an auparavant du recensement de 1996;
- L'immigration et les résidents non permanents selon les données de Citoyenneté et Immigration Canada;
- L'émigration et les personnes temporairement à l'étranger selon les données du "U.S. Department of Justice, Immigration and Naturalization Service";
- Les émigrants de retour selon la répartition du recensement de 1996;
- Les divorces selon les données du Ministère fédéral de la justice.

Since there is no data source on annual formation and dissolution of common-law unions, an alternative method was used for producing population estimates by marital status. These were derived from population estimates by legal marital status and a conversion factor based on 1996 Census data. For each specific age, sex and marital status category, factors were derived by dividing the number of enumerated persons (counts previously adjusted for net census undercount) in the de facto marital status category, by the corresponding legal marital status counts.

As for estimates by age and sex, base populations by marital status and legal marital status are adjusted to July 1st, for net census undercoverage as well as for incompletely enumerated Indian reserves. The non-permanent residents are added to the 1986 population since they became part of the Census universe only from 1991 on.

C. Census Family Estimates

Estimates of the total number of families are produced at the national, provincial and territorial levels for the period 1986-2000. The estimates are based on the 1986 to 1996 Censuses adjusted for net census undercoverage of families using data derived from the coverage studies. The 1986 adjustment was obtained by applying the ratio of the net family undercount to the net census population undercount observed in 1991, to the revised 1986 net census population undercount.

Intercensal estimates of the total number of families for Canada and the provinces are distributed by family structure (husband-wife or lone-parent families), family size (2, 3, 4, 5 and 6 or more), age of child(ren), age of parent(s) and for lone-parent families by sex of parent, as follows:

 Calculation of the proportions of census families by characteristics based on the 1986, 1991 and 1996 Censuses: Comme il n'existe pas de sources de données sur les formations et dissolutions annuelles d'unions libres, les estimations postcensitaires par état matrimonial doivent être établies à l'aide d'une méthode différente. Celles-ci sont issues des estimations de population par état matrimonial légal et d'un facteur de correction, issu des données du recensement de 1996. Pour chaque âge, sexe et catégorie d'état matrimonial, le facteur correspond au rapport entre le nombre de personnes recensées (après rajustement pour le sous-dénombrement net) selon la série état matrimonial et le nombre correspondant de la série état matrimonial légal.

Comme pour les estimations par âge et sexe, les effectifs de départ par état matrimonial et état matrimonial légal sont rajustés au 1^{er} juillet, ainsi que pour le sous-dénombrement net et les réserves partiellement dénombrées. Les résidents non permanents sont ajoutés à la population de 1986, puisqu'ils ne font partis de l'univers du recensement qu'à partir de 1991.

C. Estimations des familles de recensement

Les estimations du nombre total de familles couvrent la période 1986-2000 et sont produites pour le Canada, les provinces et les territoires. Les effectifs de départ proviennent des recensements de 1986, 1991 et 1996 rajustés pour le sous-dénombrement net des familles, tirés des études de couverture. Le rajustement pour 1986 a été obtenu en appliquant le rapport du sous-dénombrement net des familles au sous-dénombrement net de la population, observé en 1991, au sous-dénombrement net révisé de la population de 1986.

Les estimations intercensitaires du nombre total de familles pour le Canada et les provinces sont ventilées selon la structure de la famille (époux-épouse ou monoparentale), la taille de la famille (2, 3, 4, 5, 6 ou plus), l'âge des enfants, l'âge du parent ou des parents, et le sexe du parent dans le cas des familles monoparentales, selon les étapes suivantes :

 Calcul des répartitions des familles de recensement selon les caractéristiques retenues, à partir des recensements de 1986, 1991 et 1996;

- Interpolation between proportions obtained in step1 to obtain intercensal annual distributions;
- Application of interpolated proportions to the intercensal estimates of the total number of families, also obtained by interpolation.

Total provincial and territorial postcensal estimates of numbers of families are obtained by the component method. Events responsible for the formation and dissolution of families are added to or subtracted from the base. The three types of events that are accounted for are those that:

- contribute to the formation of new families (marriages);
- result in the dissolution of families (divorce, death of married persons, death of widowed persons and death of divorced persons);
- trigger a net change in the number of families (net interprovincial migration, immigration and emigration of families, net change in the number of families temporarily abroad, returning emigrant families, net change in non-permanent resident families and net change in common-law unions).

The total number of families is distributed according to family structure, sex and age of parents, family size and age of children by applying extrapolated distributions observed in previous Censuses. This last step is done only for national and provincial estimates.

D. Population Projections, 2001 to 2005

D.1 Canada, Provinces and Territories

The short-term projection scenario presented in this publication is the medium projection scenario (projection 2) taken from the publication Population Projections for Canada, Provinces and Territories, 2000-2026 (Cat. No. 91-520), released on March 13, 2001, except for two minor modifications. First, the

- Interpolation entre les proportions obtenues à l'étape 1 afin d'obtenir les répartitions annuelles intercensitaires;
- Application des proportions interpolées aux estimations intercensitaires du nombre total de familles, également obtenu par interpolation.

La méthode des composantes est utilisée pour obtenir les estimations postcensitaires du nombre total de familles par province et territoire. Les événements responsables de la formation et de la dissolution des familles sont ajoutés ou soustraits à l'effectif de départ. Les composantes dont on a tenu compte sont celles qui contribuent à :

- la formation des nouvelles familles (mariages);
- la dissolution des familles (divorces, décès de personnes mariées, décès de personnes veuves et décès de personnes divorcées);
- l'accroissement net du nombre de familles (migration interprovinciale, immigration et émigration des familles, variation nette du nombre de familles temporairement à l'étranger, familles d'émigrants de retour, solde des familles de résidents non permanents et formation nette d'unions libres).

Le nombre total de familles est ventilé selon la structure de la famille, le sexe et l'âge des parents, la taille de la famille et l'âge des enfants, en appliquant les répartitions extrapolées des recensements précédents. Cette dernière étape n'est effectuée que pour les estimations nationales et provinciales.

D. Projections de la population, 2001-2005

D.1 Canada, provinces et territoires

Le scénario de projection à court terme présenté dans cette publication reprend le scénario de projection moyen (scénario 2) de la publication Projections démographiques pour le Canada, les provinces et les territoires, 2000-2026 (No. 91-520 au catalogue), diffusée le 13 mars 2001, sauf pour deux changements mineurs. Le premier

base population is the July 1st, 2000 preliminary postcensal estimates by age and sex. A slightly different age and sex distribution was used for Projection 2. Second, the number of non-permanent residents was kept constant at the level of 259,946, observed on July 1st, 2000, instead of 240,000 used in Projection 2. All the other component assumptions were kept as in Projection 2. They are briefly:

Fertility: Level of 1.48 births per woman over the next five years.

Mortality: Life expectancy estimated at 76.1 years in the base year for males and 81.6 years for females would increase by 0.8 year and 0.5 year, respectively over the five year-period.

Immigration: From 205,468 in 2000-2001 to 225,000 in 2004-2005.

Emigration (net): From 62,000 in the base year to 64,000 by the end of the projection period.

Internal migration: Net interprovincial migration levels were derived based on an analysis of past trends and consultation with the provincial statistical focal points.

For more details on the methodology and assumptions, please refer to the publication, Population Projections for Canada, Provinces and Territories, 2000-2026 (Cat. No. 91-520).

D.2 Census Metropolitan Areas

Like the provincial projections, those at the Census Metropolitan Area (CMA) level were developed using the cohort component approach. The assumptions for total fertility rates, life expectancies at birth and flows of international migrants were derived by keeping the CMA-to-province ratios observed in the most recent years, constant throughout the projection period. Interprovincial and intraprovincial migration assumptions were also developped, based on the most recent trends.

est que la population de départ est l'estimation postcensitaire provisoire du 1^{er} juillet 2000 par âge et sexe. Une distribution par âge et sexe, légèrement différente avait été utilisée pour le scénario 2. Le second concerne le nombre de résidents non permanents qui a été maintenu constant au niveau de 259 946, observé au 1^{er} juillet 2000, au lieu de 240 000, retenu pour le scénario 2. Toutes les autres hypothèses du scénario 2 ont été conservées tel quel. En bref, elles sont :

Fécondité: Niveau de 1,48 enfant par femme au cours des cinq prochaines années.

Mortalité: L'espérance de vie, présentement estimée à 76,1 ans chez les hommes et 81,6 ans chez les femmes progresse de 0,8 an et 0,5 an respectivement en cinq ans.

Immigration: De 205 468 en 2000-2001 à 225 000 en 2004-2005.

Émigration nette : De 62 000 au début à 64 000 à la fin de la période.

Migration interne: Les soldes migratoires interprovinciaux ont été établis en se fondant sur une analyse des tendances passées et en consultant les coordonnateurs statistiques provinciaux.

Pour plus de détails sur la méthodologie et les hypothèses, veuillez vous référer à la publication, **Projections** démographiques pour le Canada, les provinces et les territoires, 2000-2026 (n° 91-520 au catalogue).

D.2 Régions métropolitaines de recensement

Tout comme la projection à l'échelle provinciale, celle à l'échelle des régions métropolitaines de recensement (RMR) a été faite à l'aide de la méthode des composantes. Les hypothèses pour l'indice synthétique de fécondité, l'espérance de vie à la naissance et les flux de migrants internationaux ont été obtenues en maintenant constants les ratios RMR: province observés dans les années récentes sur toute la période de la projection. Les hypothèses de migrations interprovinciale et infraprovinciale ont été préparées en se fondant sur les tendances les plus récentes.

The July 1st, 2000 preliminary postcensal estimates for each CMA by age and sex were used as the base population.

QUALITY OF DEMOGRAPHIC DATA

Census Data

Coverage, Response and Imputation Errors

The errors attributable to census data can be divided into two groups: response and processing errors, and coverage errors. The first group implies non-response error, misinterpretation by respondents, incorrect coding and non-response imputation. Errors in the second group primarily result from undercoverage and, to a lesser extent, overcoverage. It should be noted that both types of errors are intrinsic to any survey data.

During the process of developing the bases for estimates, an attempt was made to correct only for coverage errors in the population base. This correction, however, as it is based on the results of the coverage studies and on modelling of provincial overcoverage and territorial net undercoverage prior to 1991 as well as by age and sex, is also subject to sampling, collection, response and processing errors and uncertainty in the assumptions underlying the models. With respect to the coverage studies, statistical analysis concluded that the adjustment, although not without errors itself, improves the quality of census data (Royce, 1993). The selection of the particular modelling assumption was based on the analysis of a simulation of several feasible approaches (Michalowski, 1993b). They are deemed to be consistent over time and across geographical areas, and to provide logical results. Users should also be aware that when calculating undercoverage rates for small areas, it is likely that the underlying assumptions may be violated. If this is true, the resulting undercoverage rate would be misleading. Errors associated with these assumptions are, however, very difficult to quantify.

Les estimations postcensitaires provisoires par âge et sexe au 1^{er} juillet 2000 de chaque RMR ont servi de populations de départ.

QUALITÉ DES DONNÉES DÉMOGRAPHIQUES

Données de recensement

Erreurs de couverture, de réponse et de traitement

Les erreurs attribuables aux données de recensement peuvent être divisées en deux groupes: réponse et traitement, et couverture. Le premier groupe comprend les erreurs de non-réponse, l'interprétation erronée de la part des répondants, le codage et l'imputation des non-réponses. Les erreurs du second groupe sont dues principalement au sous-dénombrement et, à un degré moindre, au surdénombrement. Ces deux types d'erreur sont inhérents à n'importe quelle enquête.

Lors de l'élaboration des populations de départ, on a tenté de corriger les erreurs de couverture seulement. Toutefois cette correction, basée sur les résultats des études de couverture et sur la modélisation du surdénombrement des provinces et territoires par âge et sexe avant 1991, est ellemême sujette aux erreurs d'échantillonnage, de collecte, de réponse et de traitement de même qu'à la fragilité des hypothèses qui sous-tendent les modèles élaborés. En ce qui concerne les études de couverture, les tests statistiques indiquent que l'ajustement, quoique non exempt d'erreur en soi, améliore la qualité des données du recensement (Royce, 1993). Le choix des hypothèses à la base des modèles est fondé sur l'analyse de la simulation de plusieurs approches possibles (Michalowski, 1993b). Les hypothèses sélectionnées ont l'avantage d'être cohérentes dans le temps et par région géographique, ainsi que de fournir des résultats logiques. Les utilisateurs doivent se rappeler que lorsque l'on calcule les taux de sous-dénombrement pour des petites régions, il se pourrait que les hypothèses sous-jacentes ne soient pas respectées. Si tel était le cas, les taux de sousdénombrement utilisés les induiraient en erreur. Cependant les erreurs associées à ces hypothèses sont très difficiles à quantifier.

Nevertheless, the corrections to the census data due to net undercoverage improve, in general, the quality of the estimates by compensating for the differential undercoverage by age (along the cohort), sex and by province/territory across censuses. It has a direct impact on:

- the error of closure and its distribution by age and sex within provinces and territories as well as by province/territory as the net undercoverage and its distribution vary from one census to another;
- within-cohort consistency of population estimates.
 If, for example, the male cohort aged 0-4 in 1976 is traced up to the 1996 Census, it is found that its size in 1996 at ages 20-24 is smaller than in 1991 at ages 15-19. Since Canada takes in a lot of immigrants at these ages, the opposite would be expected, and, effectively, after adjustment for net census undercoverage, the cohort size increases from 1991 to 1996.

Components

Births and Deaths

Since the law requires the recording of vital statistics, final data meet very high standards. However, preliminary data which were used in 1998 and 1999 may differ from final data. For example, in 1997 the average annual absolute deviations in percent between the preliminary and final data for the ten provinces were 3.3% and 5.3% for births and deaths, respectively.

Immigration and Non-permanent Residents

Since immigration is controlled by law (the Immigration Act), data on immigrants and non-permanent residents are compiled upon arrival in Canada. These data represent only "legal" immigration and exclude illegal immigrants. Thus, for the "legal" part of international

Néanmoins, les corrections apportées aux données du recensement pour le sous-dénombrement net améliorent, en général, la qualité des estimations en compensant pour le sous-dénombrement différentiel aux différents recensements selon l'âge (en suivant une même cohorte), le sexe et par province et territoire. Cela a un impact direct sur :

- l'erreur en fin de période et sa distribution par âge et sexe à l'intérieur d'une même province ou territoire, de même que par province ou territoire, étant donné la variation du sous-dénombrement net et sa distribution d'un recensement à l'autre;
- la cohérence des estimations de population pour une même cohorte de naissance. Si, par exemple, on suit la cohorte des hommes âgés de 0-4 ans en 1976 jusqu'au recensement de 1996, on s'aperçoit qu'elle est moins nombreuse en 1996 à l'âge de 20-24 ans qu'en 1991 à l'âge 15-19 ans. Comme le Canada reçoit beaucoup d'immigrants à ces âges, on se serait attendu au contraire et, effectivement, après rajustement pour le sous-dénombrement net, la taille de la cohorte augmente entre 1991 et 1996.

Composantes

Naissances et décès

Comme la loi requiert l'enregistrement des statistiques de l'état civil, les données définitives présentent des taux de couverture très élevés. Toutefois, les données provisoires utilisées en 1998 et 1999 peuvent être différentes des données définitives. Par exemple, en 1997, la moyenne annuelle des écarts absolus en pourcentage entre les données provisoires et définitives pour les dix provinces était de 3,3 % et 5,3 % pour les naissances et les décès respectivement.

Immigration et résidents non permanents

L'immigration étant contrôlée par une loi, les données sur les immigrants et les résidents non permanents sont systématiquement collectées à leur arrivée au Canada. Ces données ne concernent que l'immigration « légale » et excluent donc les immigrants illégaux. Ainsi, les données

movement into Canada, the data are considered to be of high quality. However, some biases such as the difference between the stated province of intended residence at the time of arrival and the actual province of residence, may persist.

Total Emigration

Among all demographic components that enter into the population estimates program, total emigration is the most difficult to estimate with precision. The obvious reason for this lack of precision is that Canada does not have a complete border registration system. While immigration and non-permanent residents are well documented by the federal government, Statistics Canada has always used techniques of indirect estimation in the estimation of persons leaving the country. For this reason, the statistics available on total emigration have historically been of a lower quality than other components.

Interprovincial Migration

Since July 1993, preliminary interprovincial migration estimates have been based on Child Tax Benefit (CTB) files. Under this Program, only 79% of children aged 0-17 at the Canada level were entitled to benefits on July 1, 1996. Furthermore, there is significant coverage variation by province and territory of residence (72% to 89%). It is believed, therefore, that the preliminary CTB-based estimates are subject to more error than final estimates derived from CCRA tax files as illustrated in Text Table XIV (CD-ROM).

Intraprovincial migration

These estimates are derived from CCRA tax files and are subject to errors generally associated with small area administrative data including errors in assigning Standard Geographic Codes and errors due to boundary changes over time.

sur les entrées internationales « légales » au Canada sont considérées d'une qualité supérieure. Toutefois, des biais peuvent exister quant à la province de destination : celle envisagée par l'immigrant au moment de l'arrivée peut différer de celle où il résidera de fait.

Émigration totale

De toutes les composantes qui entrent dans le programme des estimations de population, l'émigration totale est la plus difficile à estimer avec précision. La raison qui explique ce manque de précision est que le Canada n'a pas de système d'enregistrement à ses frontières. Tandis que l'immigration et les résidents non permanents sont bien documentés par le gouvernement fédéral, Statistique Canada a toujours eu recours à des techniques d'estimations indirectes pour estimer les personnes quittant le pays. Pour cette raison, les statistiques disponibles sur l'émigration totale ont toujours été d'une moins bonne précision que celles des autres composantes.

Migration interprovinciale

Depuis juillet 1993, les estimations provisoires de la migration interprovinciale sont établies à partir des fichiers des prestations fiscales pour enfants (PFE). Sous ce programme, seulement 79 % des enfants âgés de 0 à 17 ans au niveau du Canada étaient bénéficiaires au 1^{er} juillet 1996. De plus, il existe une variation importante de la couverture selon la province ou le territoire de résidence (72 % à 89 %). Par conséquent, nous croyons que les estimations provisoires basées sur les PFE sont sujettes à des erreurs plus importantes que celles établies à partir des fichiers d'impôt de l'ADRC tel qu'illustré au Tableau explicatif XIV (CD-ROM).

Migration infraprovinciale

Ces estimations qui proviennent des fichiers d'impôt de l'ADRC sont sujettes aux erreurs généralement associés à l'exploitation des fichiers administratifs pour de petites régions telles les erreurs dans l'assignation des codes géographiques standards et celles attribuables aux changements de frontières dans le temps.

Level of Detail of Components

As a more detailed breakdown of the data introduces larger inaccuracy into the estimates, the possible error in components is augmented by the method used to distribute the estimates of totals by age and sex. It seems that, in general, the initial errors should be minimal where the distribution of annual estimates of births, deaths and immigrants is concerned, and more significant with regard to the distribution of other components (non-permanent residents, emigrants and interprovincial and intraprovincial migrants). Finally, the size of error due to the age/sex distribution may vary by period, errors in some components may have a greater impact on a given age group or sex.

Population Estimates

Assuming that the census counts adjusted for net undercoverage are accurate, the error of closure could be considered as a measure of reliability of the postcensal population estimates. Values of the error of closure are provided in Text Tables VIII to XIII (CD-ROM). When interpreting the figures from the table, the fact that the errors of closure are cumulated over a five-year period should be taken into account.

Census Family Estimates

The estimates of the total number and characteristics of families published herein contain a certain degree of error that comes, on one hand, from error inherent to censuses, and on the other, from error resulting from other data sources and estimation methods.

Certain errors are attributable to census data, specifically: (a) coverage errors; (b) response and processing errors, and (c) errors arising from differences in some concept definitions.

 (a) Coverage errors are mainly attributable to undercoverage and overcoverage. Studies conducted following the 1991 and 1996 Censuses

Ventilation des composantes

La finesse de la ventilation des données accroît les risques d'erreur de sorte que la qualité de l'estimation des composantes devient plus douteuse avec le fractionnement par âge et sexe. Il semble qu'en général, les erreurs initiales soient moindres en ce qui concerne la ventilation des nombres annuels de naissances, de décès et d'immigrants, qu'en ce qui a trait à celle des autres composantes (résidents non permanents, émigrants et migrants interprovinciaux et infraprovinciaux). Enfin, l'importance de l'erreur causée par la distribution selon l'âge et le sexe peut varier selon la période, et l'erreur relative à certaines composantes peut avoir un effet plus prononcé sur certains groupes d'âges ou sur un sexe donné.

Estimations de la population

Dans l'hypothèse où les comptes du recensement rajustés pour le sous-dénombrement net sont exacts, l'erreur en fin de période pourrait être considérée comme une mesure de fiabilité des estimations postcensitaires de la population. Les valeurs de l'erreur en fin de période sont présentées dans les tableaux explicatifs VIII à XIII (CD-ROM). Lors de leur interprétation, on devra se rappeler que les erreurs en fin de période sont cumulatives sur une période de cinq ans.

Estimations des familles de recensement

Les estimations du nombre total et des caractéristiques de familles publiées ici comportent une certaine marge d'imprécision qui provient d'une part des données des recensements et d'autre part des autres sources de données et des méthodes d'estimation.

Parmi les erreurs imputables aux données du recensement, on retrouve : a) les erreurs de couverture, b) les erreurs de réponse et de traitement, et c) les erreurs provenant des différences dans les définitions de certains concepts.

 a) Les erreurs de couverture sont dues principalement au sous-dénombrement et au surdénombrement. Les études menées suite aux recensements de 1991 et allow quantification of the phenomenon. Unfortunately, data are unavailable for censuses prior to 1991. The degree of net undercoverage varies from one province to another (Text Table V – CD-ROM).

- (b) The main response and processing errors arise from non-response, misinterpretation by respondents, coding errors, or from imputation of non-responses.
- (c) There is a difference between the census and the vital statistics definition of "family universe". Families belonging to collective households are not taken into account in census tabulations, while events experienced by the members of families, or non-family persons living in collective households, are registered by vital statistics. The magnitude of bias attributable to this difference is unknown.

Errors arising from estimation methods and from data sources other than census are difficult to estimate but are not thought to be negligible. Two types of bias can be distinguished: those related to the estimation of components for which direct statistical information is not available, and those related to the events which are considered to cause formation or dissolution of families but are not taken into account in the estimation procedure due to lack of statistical information. The first group encompasses the migration of families (international and interprovincial), dissolution of families due to death of married, widowed or divorced persons, the formation or dissolution of families related to common-law union and changes in the number of non-permanent residents' families. The second group includes: (a) the formation of families by birth of a child whose parent is either a non-family person or who is a child living with a family, (b) dissolution of families due to separation, annulment of a legal marriage, death or departure of a sole child in a lone-parent family.

1996 permettent de quantifier le phénomène. Malheureusement nous ne disposons d'aucune donnée pour les recensements antérieurs à 1991. L'importance du sous-dénombrement net varie d'une province à l'autre (tableau explicatif V – CD-ROM).

- b) Les principales erreurs de réponse et de traitement proviennent de non-réponses, d'interprétations erronées des questions, du codage des données ou de l'imputation des non-réponses.
- c) L'univers des familles n'est pas identique au recensement et à l'état civil. En effet, les familles appartenant à des ménages collectifs ne sont pas prises en compte dans les tableaux de recensement, alors qu'au contraire, les événements survenant à des personnes vivant dans des ménages collectifs, qu'elles fassent ou non partie de familles, sont enregistrés à l'état civil. L'importance du biais attribuable à cette différence n'est pas connue.

Les erreurs provenant des méthodes d'estimation et des sources de données autres que le recensement sont difficiles à estimer mais ne sont pas négligeables pour autant. On peut distinguer deux types de biais : ceux reliés à l'estimation des composantes pour lesquelles des informations statistiques directes ne sont pas disponibles et ceux reliés aux événements permettant la formation ou la dissolution des familles, mais dont on ne tient pas compte dans la procédure d'estimation, du fait d'un manque de données. Le premier type de biais touche la migration des familles (internationale et interprovinciale), la dissolution des familles due au décès de personnes mariées, veuves ou divorcées, la formation ou la dissolution de familles créées par union consensuelle et le changement dans le nombre de familles de résidents non permanents. Le second type de biais inclut: a) la formation de familles par la naissance d'un enfant pour lequel le parent est ou bien une personne ne vivant pas en famille, ou bien le parent est un enfant vivant en famille, b) la dissolution de familles due à la séparation, l'annulation d'un mariage légal, le décès ou le départ d'un enfant unique dans une famille monoparentale.

Projections

Population projections are not predictions. They represent a plausible evolution of the population based on the current population and on stated assumptions about the components of population change. Although a single projection series is presented here, it should not be interpreted as being the series favoured by Statistics Canada. It was considered sufficient, given that, on the short term (five years), variations in the basic assumptions would not have produced significant variations in the projected population.

Projections

Il convient de rappeler qu'une projection de population n'est pas une prédiction. Les chiffres obtenus représentent plutôt une évolution plausible de la population à partir de la population actuelle et de diverses hypothèses au sujet des composantes de l'accroissement démographique. Un seul scénario est présenté ici, mais il ne s'agit pas d'un scénario privilégié par Statistique Canada. Un seul scénario semblait suffisant puisque à court terme (cinq ans) des variations dans les hypothèses n'auraient pas engendré d'écarts significatifs dans les effectifs projetés.

GLOSSARY

Age: Age at last birthday in years.

Ageing (of a Population): An increase in the number of old persons as a percentage of the total population.

Average Absolute Error of Closure: Defined as the mean of the absolute percent differences between the postcensal estimates and the population adjusted for net undercoverage according to a census for the same date.

Base Population: The base population corresponds to the enumerated population of each census, adjusted to July 1 and corrected for net undercoverage.

Birth Cohort or Generation: Unless otherwise specified, refers here to a group of persons born within the 12-month period between July 1 of a given year and June 30 of the following year.

Census Coverage

Net undercoverage: Difference between undercoverage and overcoverage.

Overcoverage: Number of persons who should not have been counted in the census or who were counted more than once.

Undercoverage: Number of persons not enumerated in a census (who were intended to have been enumerated).

Census Division (CD): Refers to the general term applying to geographic areas established by provincial law, which are intermediate geographic areas between the *census subdivision* and the *province* (e.g., divisions, counties, regional districts, regional municipalities and seven other types of geographic areas made up of groups of census subdivisions).

In Newfoundland, Manitoba, Saskatchewan and Alberta, provincial law does not provide for these administrative geographic areas. Therefore, census divisions have been created by Statistics Canada in cooperation with these provinces (1996 Census Dictionary, Catalogue no. 92-351-XPE, page 178).

Census Family: Refers to a now-married couple (with or without never-married sons and/or daughters of either or both spouses), a couple living common-law (again with or without never-married sons and/or daughters of either or both partners), or a lone parent of any marital status, with at least one never-married son or daughter living in the same dwelling (1996 Census Dictionary, Catalogue 92-351-XPE, page 117).

Census Metropolitan Area (CMA): The general concept of a census metropolitan area (CMA) is one of a very large *urban* area, together with adjacent *urban* and *rural areas* which have a high degree of economic and social integration with that urban area.

A Census Metropolitan Area is delineated around an urban area (called the *urbanized core* and having a population of at least 100,000 (based on the previous census). Once an area becomes a CMA, it is retained in the program even if its population subsequently declines.

CMAs are comprised of one or more *census subdivisions (CSDs)* which meet at least one of the following criteria: (1) the CSD falls completely or partly inside the urbanized core; (2) at least 50% of the employed labour force *living* in the CSD

works in the urbanized core; or (3) at least 25% of the employed labour force working in the CSD *lives* in the urbanized core (1996 Census Dictionary, Catalogue no. 92-351-XPE, page 181).

Cohort: Represents a group of persons who have experienced a specific demographic event during a given year. Thus, the married cohort of 1996 consists of the number of persons who married in 1996. Persons born within a specified year could be referred to as a generation.

Common-law Union: Union consisting of a male and a female living together as husband and wife, without being legally married.

Components of Demographic Change: Any of the classes of events generating population movement variations. Births, deaths, migration, marriages, divorces and new widowhoods are the components responsible for the change in total population or in the age, sex and marital status distribution of the population.

Dependency Ratio: The total population is customarily divided up into three broad age groups: children (ages 0-14), adults (ages 15-64) and aged persons (ages 65 and over). The following ratios may be defined on the basis of this classification:

- (a) child dependency ratio, i.e., the number of children per adult (15-64);
- (b) age dependency ratio, i.e., the number of aged persons per adult (15-64);
- (c) total dependency ratio, i.e., the sum of the child and the aged dependency ratios.

Error of Closure: Difference between the postcensal estimate and the population adjusted for net undercoverage according to a census for the same date.

Family Structure: Census families are classified as follows:

Husband-wife Family. A husband-wife family consists of a legally-married male and female (with or without never-married children, regardless of age), or two persons living in a common-law union (with or without never-married children, regardless of age).

Lone-parent Family. A lone-parent family consists of a father or a mother, with one or more never-married children, regardless of age, living in the same dwelling.

Internal Net: Sum of intraprovincial and interprovincial migration.

International Migration: Movement of population between Canada and a foreign country which involves a change in residence. A distinction is made between landed immigrants from other countries who settle in Canada, total emigrants and the net change in non-permanent residents.

Interprovincial Migration: Movement from one province to another involving a permanent change in residence. A person who takes up residence in another province is an *out-migrant* with reference to the province of origin, and an *in-migrant* with reference to the province of destination.

Intraprovincial Migration: Movements of population from one census division or census metropolitan area to another within a province, involving a permanent change in residence.

Marital Status: Indicates the conjugal status of a person. Although marital status definitions correspond to census concepts, only the categories single, married, widowed or divorced are considered.

Single - Persons who have never been married, or persons whose marriage has been annulled and who have not remarried, and do not live common-law.

Married (including common-law) - Persons whose husband or wife is living, unless a divorce has been obtained. Persons separated and persons living common-law are also included in this category.

Widowed: Persons who have lost their spouse through death and who has not remarried, and who do not live common-law.

Divorced: Persons who has obtained a divorce and who has not remarried, and who do not live common-law.

Legal Marital Status

Single - Persons who have never been married, or persons whose marriage has been annulled and have not remarried.

Married (Legally) - Persons whose husband or wife is living, unless a divorce has been obtained. Persons separated and persons living common-law are also included in this category.

Widowed: Persons who have lost their spouse through death and who has not remarried.

Divorced: Persons who has obtained a divorce and who has not remarried.

Mean Age: The mean age of a population is the average age of all its members.

Median Age: The median age is an age "x", such that exactly one half of the population is older than "x" and the other half is younger than "x".

Natural Increase: Excess of births over deaths.

Non-permanent Residents: The five following groups are referred to as non-permanent residents:

- persons residing in Canada claiming refugee status;
- persons residing in Canada who hold a student authorization;
- persons residing in Canada who hold an employment authorization;
- persons residing in Canada who hold a Minister's permit;
- all non-Canadian born dependants of persons claiming refugee status, or of persons holding student authorizations, employment authorizations or Minister's permits and living in Canada.

Population: Estimated population and population according to the census are both defined as being the number of Canadians whose usual place of residence is in that area, regardless of where they happened to be on Census Day. Also

included are any Canadians staying in a dwelling in that area on Census Day and having no usual place of residence elsewhere in Canada, as well as those considered "non-permanent residents".

Population Estimate

(a) Preliminary, Updated and Final Postcensal

Population estimates produced by using data from the most recent census adjusted for net census undercoverage and estimates of the components of demographic change since that last census.

(b) Intercensal

Population estimate derived by using postcensal estimates and data from the most recent census counts adjusted for net undercount preceding and following the year in question.

Population Growth: Change in population size from one date to another.

Population Projection: The projection differs from the estimate in that its objective is to establish what the evolution of the population will be in the future by size, geographical distribution and other demographic characteristics using selected hypotheses. A reference is made to a projection when the formulated hypotheses appear to be highly probable. Generally, population projections are restricted to a short term period.

Rate

Age-Specific Fertility: Ratio of the number of births occurring in a given age group to the number of females of a given age per 1,000.

Birth: Refers to a rate calculated by relating the number of live births observed in a population during a given period to the size of the population during that period per 1,000.

Divorce: Refers to the number of divorces per 1,000 population.

First Marriage: Ratio of the number of first marriages observed in a population in a given period to the number of persons in that population regardless of the marital status per 1,000.

Mortality: Ratio of the annual number of deaths occurring in a population or sub-population during a given period to the number exposed to the risk of dying during the same period per 1,000.

Net Undercoverage of Population or Census Families: Difference between undercoverage rate and overcoverage rate in percent.

Overcoverage of Population or Census Families: The ratio expressed in percentage of the number of persons or census families who should not have been counted in the census or who were counted more than once to the total number of persons or census families that should have been enumerated in the census in percent.

Population Growth: Ratio of population growth between the year t and t+1, to the average population of that period per 1,000.

Total Fertility: Average number of children per female according to the fertility in a given year computed by the summation of the series of age-specific fertility rates.

Total First Marriage: Proportion of males or females marrying before their 50th birthday according to nuptiality conditions in a given year computed by the summation of the rates by age at first marriage.

Undercoverage of Population or Census Families: The ratio, expressed in percentage, of the estimated number of persons or census families not enumerated in the census (who were intended to have been enumerated) to the total number of persons or census families that should have been enumerated in the census.

Residual: Difference between population growth as measured by population estimates of two consecutive years and the sum of the components. This difference results from the distribution of the closure error between years within the quinquennial period.

Sex Ratio: The ratio of the number of men to the number of women. This is not to be confused with the sex ratio at birth, which is the ratio of the number of liveborn boys to the number of liveborn girls. This ratio is usually expressed as an index, with the number of females taken to be a base of 100.

Total Emigration: Comprised of emigrants, returning emigrants and net variation in the number of persons living temporarily abroad.

Emigrants: Canadian citizens or landed immigrants who have left Canada to establish a permanent residence in another country.

Returning emigrants: Canadian citizens or landed immigrants who have emigrated from the country and subsequently returned to Canada to re-establish a permanent residence.

Persons living temporarily abroad: Canadian citizens and landed immigrants living temporarily abroad who have not maintained a usual place of residence in Canada.

Total Net: Sum of international and internal migration (at the provincial level, intraprovincial migration is nil).

Vital Events: Includes all the demographic events (that is to say births, deaths, marriages and divorces) for which there exists a legal requirement to inform the Provincial or Territorial Registrar's Office.

Year: Unless otherwise specified, a year, refers to the period beginning July 1 of a given year and ending June 30 of the following year.

LEXIQUE

Accroissement démographique: Variation de l'effectif de la population entre deux dates.

Accroissement naturel: Excédent des naissances sur les décès.

Âge: Âge atteint au dernier anniversaire en années révolues.

Âge médian: L'âge médian est l'âge "x" tel qu'il divise une population en deux groupes d'effectifs égaux, l'un composé uniquement des individus d'âge supérieur à "x", l'autre des individus d'âge inférieur à "x".

Âge moyen: L'âge moyen d'une population est la moyenne des âges de ses membres.

Année: À moins d'indication contraire, la période qui s'étend du 1er juillet d'une année au 30 juin de l'année suivante.

Cohorte: Ensemble des personnes touchées par un phénomène démographique particulier pour une année donnée. La cohorte des mariés de 1996 désigne donc l'ensemble des personnes qui se sont mariées en 1996. La cohorte, dans le cas des naissances, porte le nom de génération.

Complétude du recensement

Sous-dénombrement. Nombre de personnes qui n'ont pas été recensées (mais qui étaient visées par le recensement).

Sous-dénombrement net. Différence entre le sous-dénombrement et le surdénombrement.

Surdénombrement. Nombre de personnes qui n'auraient pas dû être recensées ou qui l'ont été plus d'une fois.

Composantes de l'accroissement démographique: Chacune des classes d'événements générateurs des mouvements ou variations de population. Ainsi les naissances, décès, migrations, mariages, divorces et entrées en veuvage sont des composantes, car elles altèrent soit l'effectif de la population totale, soit sa composition selon l'âge, le sexe et l'état matrimonial.

Division de recensement (DR): Terme générique qui désigne les régions géographiques établies en vertu de lois provinciales et qui constituent les régions intermédiaires entre la *subdivision de recensement* et la *province* (par exemple, divisions, comtés, districts régionaux, municipalités régionales et sept autres genres de régions géographiques formées de groupes de subdivisions de recensement).

Les lois provinciales de Terre-Neuve, du Manitoba, de la Saskatchewan et de l'Alberta ne prévoient pas la création de ces régions administratives. C'est pourquoi les divisions de recensement ont été établies par Statistique Canada en collaboration avec les provinces (*Dictionnaire du recensement de 1996*, n° 92-351-XPF au catalogue, page 198).

Émigration totale: Comprend les émigrants, les émigrants de retour et la variation nette du nombre de personnes temporairement à l'étranger.

Émigrants : Citoyens canadiens ou immigrants reçus ayant quitté le Canada pour s'établir en permanence dans un pays étranger.

Émigrants de retour : Citoyens canadiens ou immigrants reçus ayant émigré du pays et qui reviennent s'établir au Canada.

Personnes temporairement à l'étranger : Citoyens canadiens ou immigrants reçus vivant temporairement à l'étranger et ne possédant plus de lieu habituel de résidence au Canada.

Erreur absolue moyenne en fin de période: Moyenne des valeurs absolues des écarts relatifs entre les populations recensées et estimées.

Erreur en fin de période: Différence entre la population donnée par un recensement rajusté pour le sous-dénombrement net et l'estimation postcensitaire à la date du recensement.

Estimation de la population:

a) Postcensitaire provisoire, mise à jour et définitive

Estimation de l'effectif de la population obtenue en utilisant les résultats du dernier recensement disponible rajustés pour le sous-dénombrement net et l'estimation de l'accroissement démographique survenu depuis la date de ce dernier recensement.

b) Intercensitaire

Estimation de l'effectif de la population obtenue en utilisant les estimations postcensitaires et les résultats rajustés pour le sous-dénombrement net des deux recensements encadrant l'année considérée.

État matrimonial : Indique la situation conjugale d'une personne. Bien que les définitions des catégories d'état matrimonial correspondent aux concepts du recensement, on ne considère que les catégories célibataire, marié(e) (y compris union libre), veuf(ve) et divorcé(e).

Célibataire – Personne qui n'a jamais été mariée, ou personne dont le mariage a été annulé et qui ne s'est pas remariée, et ne vit pas en union libre.

Marié(e) (y compris union libre) – Personne dont le conjoint est vivant, à moins que le couple ne soit divorcé. Les personnes séparées et les personnes vivant en union libre sont incluses dans cette catégorie.

Veuf(ve) - Personne dont le conjoint est décédé, qui ne s'est pas remariée et ne vit pas en union libre.

Divorcé(e) - Personne qui a obtenu un divorce, ne s'est pas remariée et ne vit pas en union libre.

État matrimonial légal : Indique la situation conjugale légale d'une personne. Bien que les définitions des catégories d'état matrimonial correspondent aux concepts du recensement, on ne considère que les catégories célibataire, légalement marié(e), veuf(ve) et divorcé(e).

Célibataire – Personne qui n'a jamais été mariée, ou personne dont le mariage a été annulé et qui ne s'est pas remariée.

Légalement marié(e) — Personne dont l'époux ou l'épouse est vivant à moins que le couple ne soit divorcé. Les personnes séparées sont incluses dans cette catégorie.

Veuf(ve) - Personne dont l'époux ou l'épouse est décédé et qui ne s'est pas remariée.

Divorcé(e) - Personne qui a obtenue un divorce et qui ne s'est pas remarié.

Famille de recensement: Couple actuellement marié (avec ou sans fils et/ou filles jamais mariés des deux conjoints ou de l'un des deux), couple vivant en union libre (avec ou sans fils et/ou filles jamais mariés des deux partenaires ou de l'un des deux) ou parent seul (peu importe son état matrimonial) demeurant avec au moins un fils ou une fille jamais marié. (Dictionnaire du recensement de 1996, n° 92-351-XPF, page 130).

Génération: Désigne ici, sauf indication contraire, l'ensemble des personnes nées durant la période de 12 mois, comprise entre le 1^{er} juillet d'une année et le 30 juin de l'année suivante.

Migration infraprovinciale: Ensemble des déplacements d'une division de recensement ou d'une région métropolitaine de recensement vers une autre à l'intérieur de la même province, accompagnés d'un changement permanent de résidence.

Migration internationale: Ensemble des déplacements entre le Canada et l'étranger, accompagnés d'un changement de résidence. On distingue à cet égard les immigrants reçus qui viennent s'établir au Canada, les émigrants totaux ainsi que le solde des résidents non permanents.

Migration interprovinciale: Ensemble des déplacements d'une province vers une autre, accompagnés d'un changement permanent de résidence. Un individu qui effectue un tel déplacement sera un *sortant* pour sa province d'origine et un *entrant* pour sa province de destination.

Population: La population estimée répond à la même définition que celle du recensement. Il s'agit donc du nombre de Canadiens qui ont leur lieu habituel de résidence, sans égard au lieu où ils se trouvaient le jour du recensement. Sont également comptés les Canadiens séjournant dans un logement de la région en cause le jour du recensement et n'ayant pas de lieu habituel de résidence ailleurs au Canada, de même que ceux qui sont considérés comme des résidents non permanents.

Population de départ: La population de départ correspond à la population énumérée à chaque recensement, rajustée au 1^{er} juillet et corrigée pour le sous-dénombrement net.

Projection démographique: La projection diffère de l'estimation en ce qu'elle vise à établir ce que sera l'évolution future d'une population donnée, taille, distribution spatiale et caractéristiques démographiques, dans telles ou telles hypothèses. On ne parle de prévision que lorsque les hypothèses formulées apparaissent très probables. En général, les prévisions démographiques se restreignent au court terme.

Rapport de dépendance: On a coutume de répartir la population en trois grands groupes d'âges: 0-14 ans (enfants), 15-64 ans (adultes) et 65 ans et plus (personnes âgées), ce qui permet le calcul des rapports suivants:

- (a) le rapport de dépendance des enfants, égal au nombre d'enfants par adulte (15-64);
- (b) le rapport de dépendance des personnes âgées qui représente le nombre de personnes âgées par adulte (15-64);

(c) le rapport global de dépendance qui est la somme des rapports de dépendance des enfants et des personnes âgées.

Rapport de masculinité: Rapport de l'effectif du sexe masculin à l'effectif du sexe féminin. Le rapport de masculinité à la naissance désigne le rapport des naissances masculines aux naissances féminines. On exprime généralement ce rapport comme un indice, où l'effectif du sexe féminin sert de base 100.

Région métropolitaine de recensement (RMR): Le concept général de région métropolitaine de recensement (RMR) s'applique à un grand *noyau urbain* ainsi qu'aux *régions urbaines* et *rurales* adjacentes dont le degré d'intégration économique et sociale avec ce noyau urbain est très élevé.

Une RMR est délimitée à partir d'un *noyau urbanisé* lorsque ce dernier compte au moins *100 000 habitants*, *(d'après les résultats du recensement précédent)*. Lorsqu'une région devient une RMR, elle continue de faire partie du programme même si, ultérieurement, elle subit une baisse de population.

Chaque RMR est constituée *d'une subdivision de recensement (SDR)* ou plus répondant à au moins un des critères suivants: (1) la SDR se trouve entièrement ou en partie dans le noyau urbanisé; (2) au moins 50 % de la population active occupée *demeurant* dans la SDR *travaille* dans le noyau urbanisé; (3) au moins 25 % de la population active occupée *travaillant* dans la SDR *demeure* dans le noyau urbanisé (*Dictionnaire du recensement de 1996*, n° 92-351-XPF au catalogue, page 224).

Résidents non permanents: Les cinq groupes suivants constituent ce qu'on définit comme résidents non permanents:

- les personnes résidant au Canada qui demandent le statut de réfugié;
- les personnes résidant au Canada qui détiennent une autorisation d'études;
- les personnes résidant au Canada qui détiennent une autorisation d'emploi;
- les personnes résidant au Canada qui détiennent un permis ministériel:
- toutes les personnes à charge des demandeurs du statut de réfugié, des titulaires d'une autorisation d'emploi ou d'un permis ministériel qui sont nées à l'extérieur du Canada et résident au Canada.

Résidu: Différence entre l'accroissement démographique à partir des effectifs de la population de deux années consécutives et celui obtenu par la somme des composantes. Cette différence résulte de la répartition de l'erreur en fin de période entre les différentes années de la période quinquennale concernée.

Solde interne: Somme de la migration infraprovinciale et de la migration interprovinciale.

Solde total: Somme de la migration internationale et de la migration interne (au niveau provincial, la migration infraprovinciale est nulle).

Statistiques de l'état civil: Elles couvrent l'ensemble des événements démographiques (i.e. les naissances, les décès, les mariages et les divorces) pour lesquels il existe une obligation légale d'aviser le bureau du registraire de la province ou du territoire.

Structure de la famille de recensement: Les familles de recensement sont classées de la façon suivante:

Famille époux-épouse. Une famille époux-épouse se compose d'un homme et d'une femme légalement mariés (avec ou sans enfants célibataires, peu importe leur âge) ou de deux personnes vivant en union consensuelle (avec ou sans enfants célibataires, peu importe leur âge).

Famille monoparentale. Une famille monoparentale se compose d'un père ou d'une mère, ayant un ou plusieurs enfants célibataires, peu importe leur âge, vivant dans le même logement.

Taux

Accroissement démographique: rapport de l'accroissement de la population entre l'année t et t+1 à la population moyenne de ces deux années exprimé en pour 1 000.

Divortialité: nombre de divorce pour 1 000 habitants.

Fécondité par âge: rapport à l'effectif des femmes d'un âge donné, des naissances observées dans ce groupe exprimé en pour 1 000.

Indice synthétique de fécondité: nombre moyen d'enfants par femme selon les conditions de fécondité d'une année donnée. Il résulte de la sommation des taux de fécondité par âge.

Indice synthétique de nuptialité des célibataires: proportion d'hommes ou de femmes qui se marieraient avant leur cinquantième anniversaire selon les conditions de nuptialité d'une année donnée. Il résulte de la sommation des taux de nuptialité des célibataires par âge exprimé en pour 1 000.

Mortalité: fréquence relative des décès au sein d'une population ou d'une sous-population ou rapport à un effectif donné des décès survenus dans ce groupe exprimé en pour 1 000.

Natalité: rapport du nombre des naissances observées dans une population à l'effectif total de cette population exprimé en pour 1 000.

Primo-nuptialité: rapport du nombre des premiers mariages observés dans une population à l'effectif de cette population sans distinction d'état matrimonial exprimé en pour 1 000.

Sous-dénombrement de la population ou des familles de recensement: rapport, exprimé en pourcentage, du nombre estimé de personnes ou des familles de recensement qui n'ont pas été recensées (mais qui étaient visées par le recensement) à celui de l'ensemble des personnes ou des familles de recensement visées par le recensement.

Sous-dénombrement net de la population ou des familles de recensement: différence entre le taux de sousdénombrement et le taux de surdénombrement.

Surdénombrement de la population ou des familles de recensement: rapport, exprimé en pourcentage, du nombre de personnes ou des familles de recensement qui n'auraient pas dû être recensées ou qui l'ont été plus d'une fois au nombre total des personnes ou des familles de recensement visées par le recensement.

Union consensuelle ou union libre: Union formée d'un homme et d'une femme demeurant ensemble comme épouxépouse, sans être légalement mariés.

Vieillissement démographique: Évolution caractérisée par une augmentation de la proportion des personnes âgées au sein d'une population.

Statistique

Statistics Canada

www.statcan.ca

Canadä

Minimum System Requirements

- IBM PC compatible 486, or better.
- Spreadsheet software (e.g. Excel 5.0) or Microsoft Windows '95 or greater.
- 16 MB of RAM.
- 10 MB free space on hard disk.
- CD-ROM reader

Installation

- 1 From the File menu in Program Manager, Select Run. (In Windows '95/NT 4.0, select Start, then Run.)
- Type x: instal, where x is your compact disc drive letter, then choose
- 3. Follow the installation procedure on the screen.

For Standalone Installation only:

A program group named "Statistics_Statistique Canada" will be created. Within this program group, an icon will be created. Double click on this icon to start the application.

For questions regarding the CD-ROM, please contact 1-613-951-2320.

Configuration minimale exigée

- Micro-ordinateur compatible IBM 486, ou supérieur
- Logiciel de type chiffrier (p. ex. Excel 5.0) ou Microsoft Windows '95 ou superieur
- 16 megaoctets (Mo) de mémoire vive
- 10 Mo d'espace libre sur le disque dur
- Lecteur de CD-ROM

Installation

- Du menu Fichier du Gestionnaire de programmes, sélectionnez Exécuter. (Pour Windows '95/NT 4.0, sélectionnez Démarrer, puis Exécuter.)
- Tapez x:instal, considérant que x est votre unité de disque compact, choisissez ensuite OK
- 3. Suivez la procédure d'installation à l'écrar

Pour installation autonome seulement

 Un groupe programme appelé «Statistics_Statistique Canada» sera créé. Dans ce même groupe, une icône sera créée. Cliquez deux fois sur cette icône pour demarrer l'application.

Si vous avez des guestions concernant le CD-ROM veuillez appeler au 1-613-951-2320.

This item is accompanied by a CD-ROM.

The contents of the CD-ROM are available via the web.

Please check the University of Toronto Catalogue for this record for location.

Bet enline

with Statistics Canada's Electronic Publications!

Go virtual with Statistics Canada's electronic publications. From Arts and Culture to Travel, Transport and Warehousing, you have over 120 titles in 18 topic categories to choose from — and the list is growing every day.

Savea branché

grâce aux publications électroniques de Statistique Canadal

Vivez au rythme virtuel des publications électroniques de Statistique Canada. De la rubrique Arts et culture à la rubrique Voyages, transport et entreposage, vous trouverez plus de 120 titres répartis en 18 catégories, et la liste s'allonge de jour en jour.

Save money.

Order online and you'll receive a 25% price reduction from that of our print publications.

One price, many rewards.

Statistics Canada subscriptions offer indefinite access to your publication and up to three years of its previous issues.

Built to last.

Unlike paper, e-versions won't yellow, fade or tear. They will stay intact and accessible for years to come!

Find the information you need now.

Online documents allow you to search, locate and print exactly what you are looking for.

Be the first to know.

Our electronic publications are regularly available before print versions, so you always have access to the most current releases.

Feel safe about ordering online.

Our secure site makes using your credit card online safe and easy. Guaranteed.

Be green.

By consciously choosing electronic over paper, you're doing your part to be ecologically friendly. Feel good about doing business, respecting the environment and saving precious resources.

Save time.

Access your publication on the day of release - no more waiting for delivery.

Put the data to work.

Copy text from our online publications right into your documents and databases.

Access anywhere, anytime.

Get up-to-date detailed information quickly and efficiently, regardless of location and time constraints.

On our site, go to <u>Products and Services</u>, select <u>Downloadable publications</u> (\$) and simply follow the steps to subscribe or purchase. It's that easy!

Économisez de l'argent.

Les achats en ligne vous donnent droit à un rabais de 25 % sur le prix des ouvrages imprimés.

Un seul prix, beaucoup de primes.

À Statistique Canada, les abonnements sont assortis d'un accès illimité à la publication que vous choisissez et aux numéros antérieurs pour une période pouvant couvrir jusqu'à trois années.

Contrairement aux documents imprimés, les versions électroniques ne jaunissent pas, ne se décolorent pas et ne se déchirent pas. Elles restent intactes et accessibles pendant des années!

Trouvez les renseignements que vous cherchez maintenant.

Les documents en ligne vous permettent de chercher, de trouver et d'imprimer exactement ce que vous désirez obtenir.

Prenez la tête du peloton.

Nos publications électroniques sortent généralement avant les versions imprimées; vous avez donc accès aux parutions les plus récentes.

Soyez rassuré quant aux commandes en ligne.

Grâce à la sûreté de notre site, l'utilisation en ligne de votre carte de crédit est simple et sans risque. C'est garanti.

Pensez «écolo».

En optant pour les produits électroniques plutôt que les documents imprimés, vous participez à la préservation de l'environnement. Faites d'une pierre, trois coups : travaillez, respectez l'environnement et conservez des ressources précieuses.

Gagnez du temps.

Accédez à la publication le jour de sa parution - aucun délai de livraison.

Mettez les données à l'oeuvre.

Copiez des extraits de nos publications en ligne directement dans vos documents et bases de données.

Accès partout, en tout temps.

Obtencz rapidement et efficacement des renseignements détaillés et à jour, peu importe les contraintes de lieu et de temps.

ontraintes de lieu et de temps.

Sur notre site, cliquez sur Produits et services,

Vous n'avez qu'à suivre les étapes pour acheter ou vous abonner. C'est aussi simple que cela!

puis sélectionnez Publications téléchargeables (\$).
